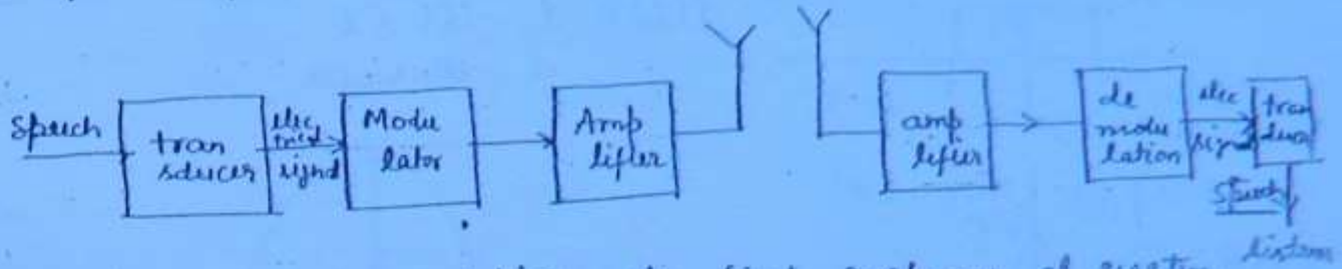
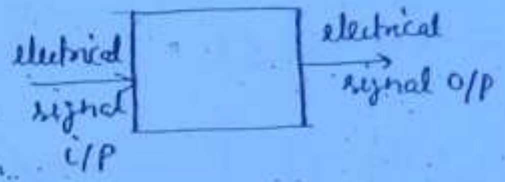
2

Speech signal → 300Hz → 3400Hz



* SS → we ~~or~~ are concentating to find response of system



to find response of a system, we use following Rules/tools-

1. Fourier series
2. Fourier transforms
3. Laplace transforms
4. Z- transforms

Audio signal → 20Hz - 20KHz

Video signal → 0 - 5MHz.

data signal → range is based on application

Signal → is a quantity having associated information with it.

is a function of time.

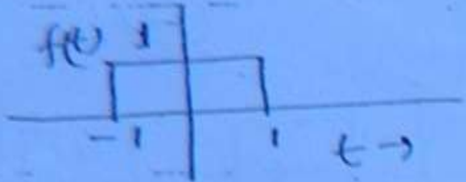
we deal with electrical signal which are voltages or currents, which are both functions of time. In general signal is a function time f(t). (electrical)

But signal is not always a function of time

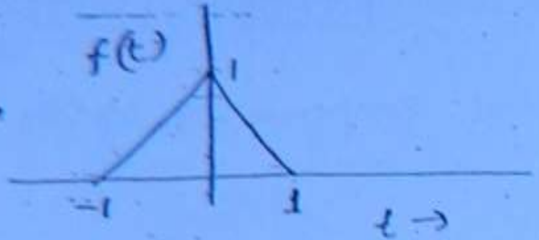
collect still frame and play back to it is video signal (normally at 24 frames/ second where we play back the still frames).

In Motion picture signal is three dimensional $f(x, y, t$

④



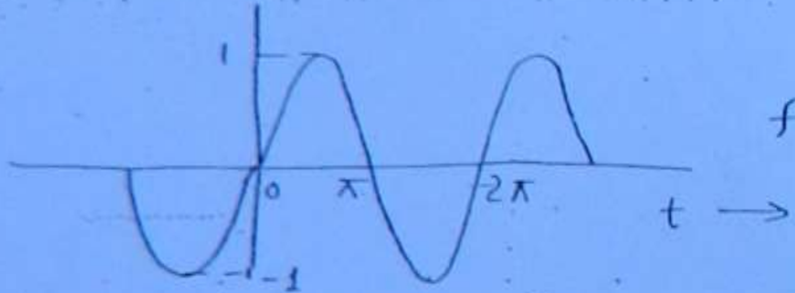
$f(t) = 1 \quad -1 \leq t \leq 1$
$\quad\quad\; 0 \quad$ otherwise



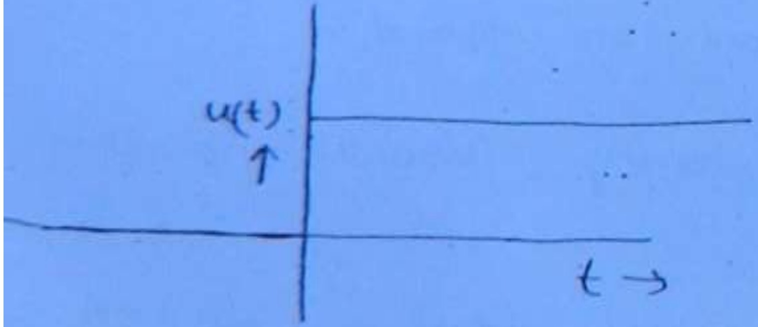
$f(t) = \quad -1 \leq t \leq 0$
$\quad = t+1$
$\quad = -t+1 \quad 0 \leq t \leq 1$

$f(t) = e^{-at}$

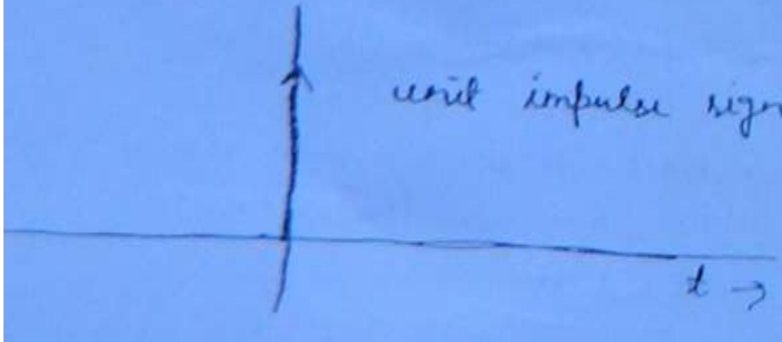
$f(t) = e^{at}$



$f(t) = \sin t$



$u(t) = 1 \quad t \geq 0$
$\quad\quad\; 0 \quad t < 0$



unit impulse signal

existence is split second
effect is anormous.

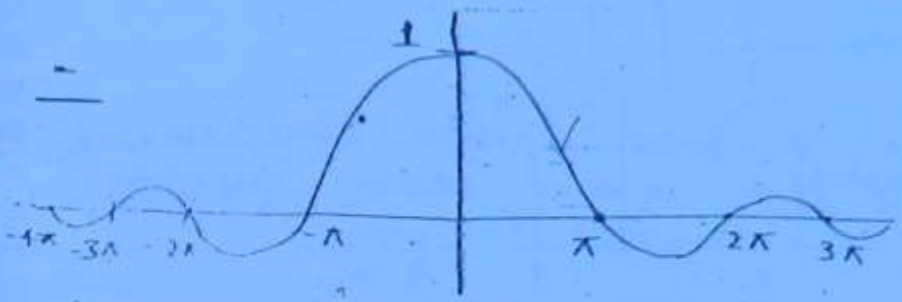
$\delta(t) = 0 \quad t \neq 0$
$\quad = \cancel{0} \quad t = 0$
$\quad \neq 0 \quad t = 0 \quad (\infty)$ very large

$\text{rect}\ \frac{(t-1)}{2}$ $3/4$

$\text{rect}(t+3/4)$

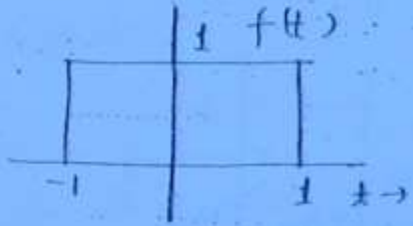
$$\int_{-\infty}^{\infty} f(t)\,dt = 1 \rightarrow \int_{-\infty}^{\infty} \delta(t)\,dt = 1$$

ⓢ

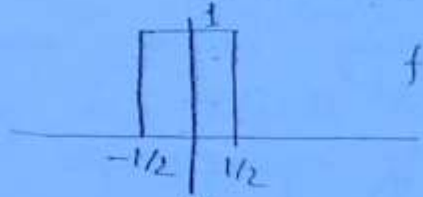


$f(t) = \frac{\sin t}{t} = Sa(t)$

$= \text{Sinc}(t/\pi)$

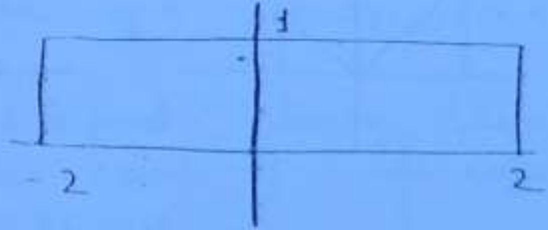


$f(t) = \text{rect}(\frac{t}{2})$



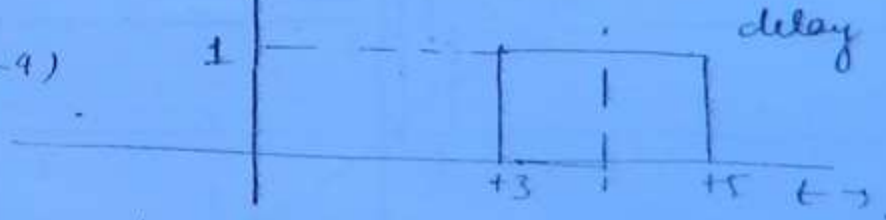
$f(2(t))$ } $f(t) = \text{rect}(t)$

time scaled version of f(t) (amplified time-axis change



$f(t/2)$ $f(t) = \text{rect}(t/4)$

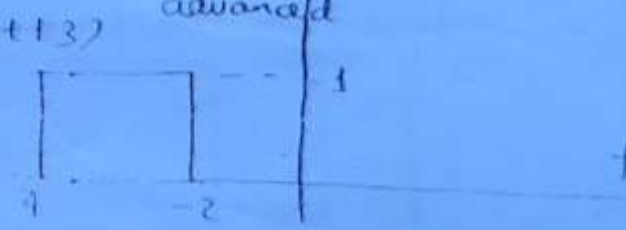
$\text{rect}(t-4)$ delay



time shifted Version of given signal f(t)

$\text{rect}(t+3)$ advanced

$f(t-4)$



$f(t+3)$

[(divide all time (instant) by a)] $f(t) \xrightarrow{} f(at)$ $a>1 \rightarrow$ compress

$0<a<1 \rightarrow$ expansion

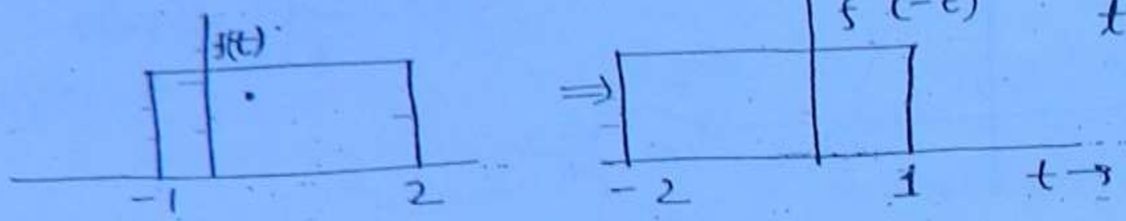
↗ (subtract T from all instant) shift

$f(t) \xrightarrow{t \to (t+T)}$ → advanced (left)

shift

$t \to (t-T)$ → delayed (right)

↳ add (T to all instant)



time reversal operation

$f(t) = 1 \quad -1 \leq t \leq 2$

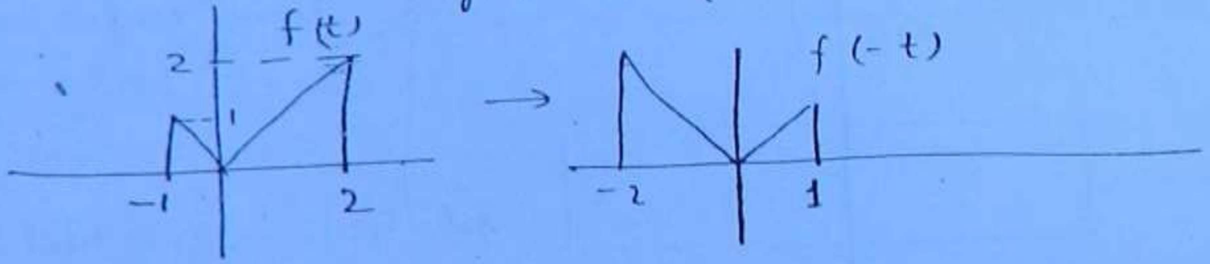
$\quad\;\; 0 \quad$ otherwise

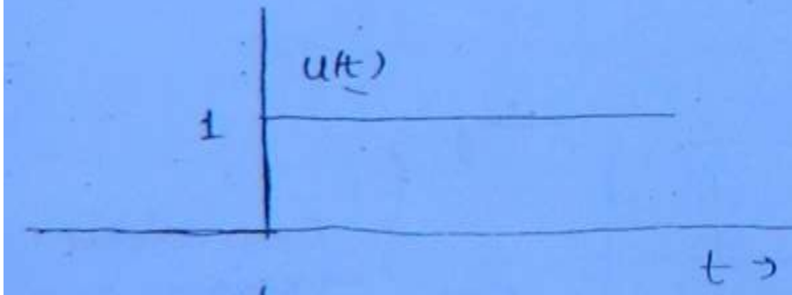
$f(-t) = \quad -1 \leq -t \leq 2$

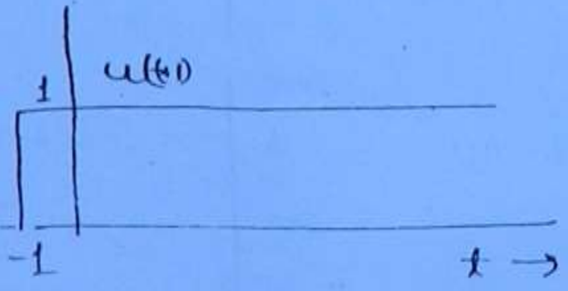
$\quad\;\; = \quad 1 \geq t \geq -2$

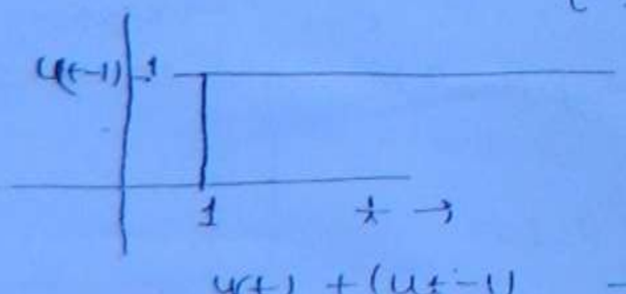
$\quad\;\; 0$ otherwise

obtained by rotating signal across Y axis / by 180° or by taking mirror image of signal abt Y-axis.

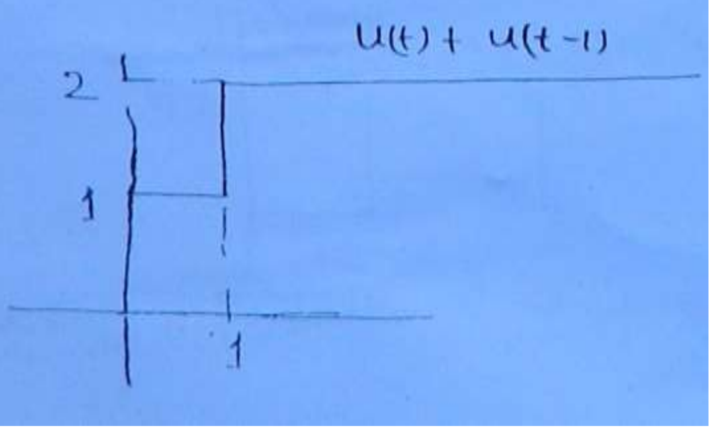




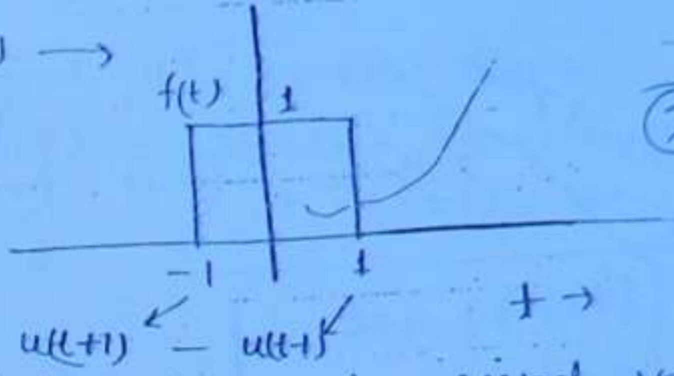




u(t) + (u t−1) →

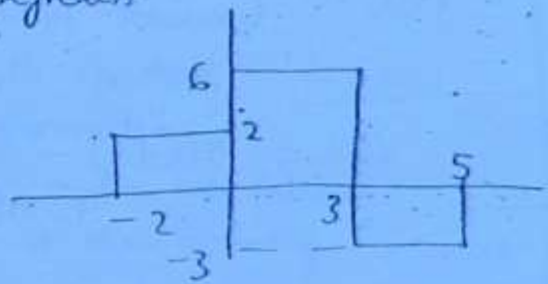


f(t) = u(t+1) - u(t-1) →



u(t) → indicates change in signal value from 0 to 1 exactly at t = 0

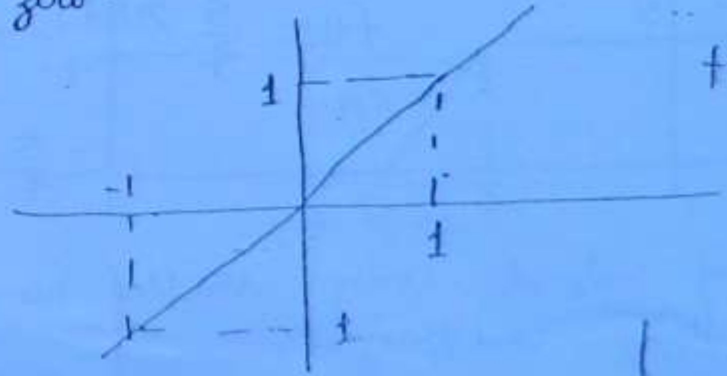
Q. represent the following signal using shifted unit step signals.



$2u(t+2) + 4\,u(t) - 9\,u(t-3) + 3\,u(t-5)$

as long as signal is nonzero only for a finite inter of time then some of coefficient will be zero as in above eg → 2+4-9+3=0

(*). A signal having step changes in finite interval time then some of all cofficient of shifted unit step signal will be zero.

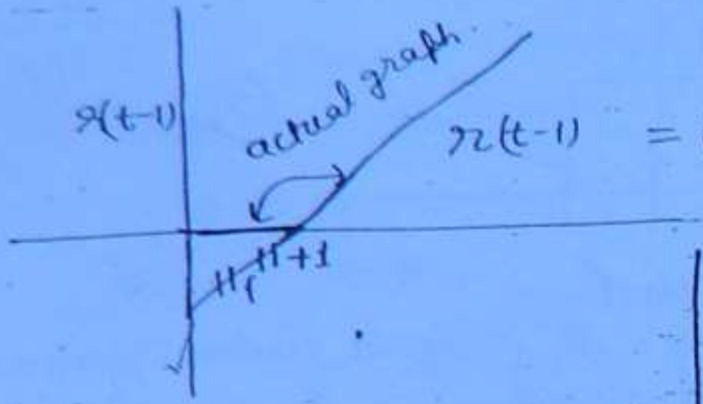


f(t) = t [not ramp signal]

x(t)· u(t)

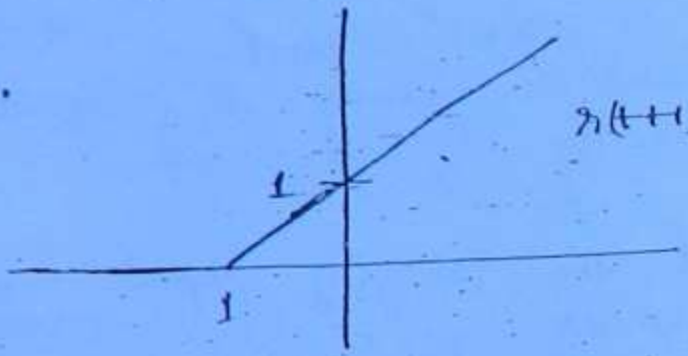
$f(t) = \begin{cases} t & 0 \leq t \leq \infty \text{ or } t \geq 0 \\ 0 & \text{otherwise} \end{cases}$ ramp signal

3



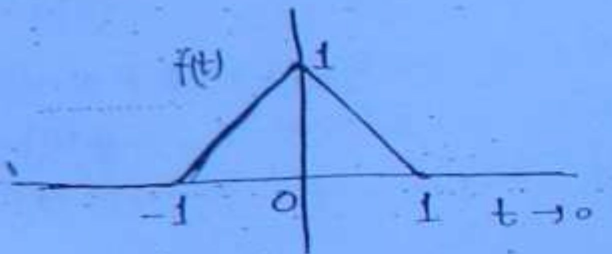
$r(t-1) = (t-1)$ for $t \geq 1$

$0 \quad t < 1$



$r(t+1) = (t+1)$ for $t \geq -1$

0 otherwise

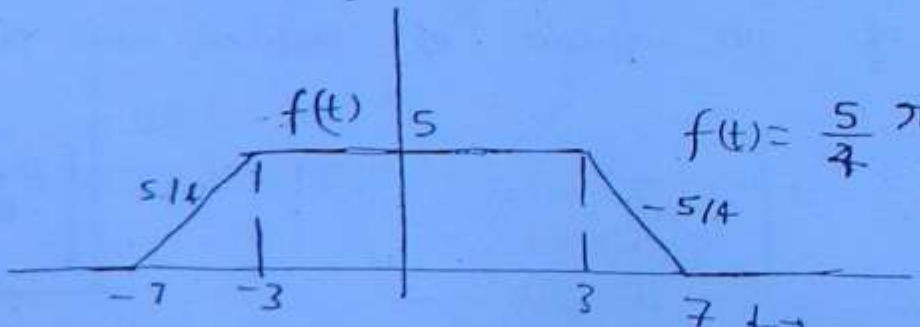


$f(t) = r(t+1) - 2\,r(t) + r(t-1)$

r(t) represent change in slope at $t=0$ from $(0 \to 1)$ slope

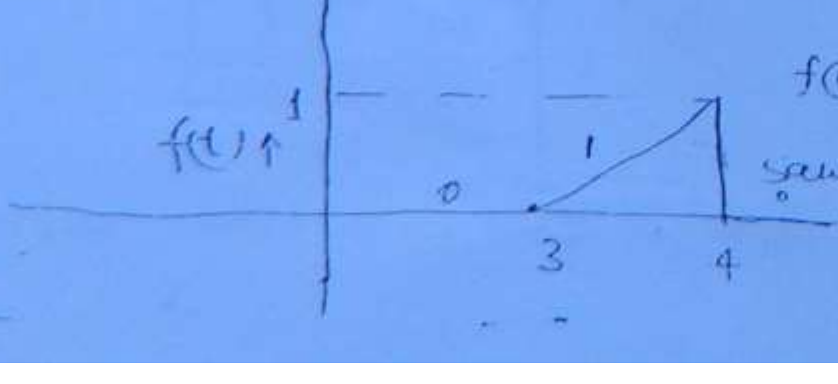
if signal is finite interval signal some of coefficients will be zero → eg $1-2+1 = 0$

Q. Represent following signal using shifted ramp signal.



$$f(t) = \frac{5}{4} r(t+7) - \frac{5}{4} r(t+3) - \frac{5}{4} r(t-3) + \frac{5}{4} r(t+7)$$

Q. represent following signal using shifted ramp signals and shifted unit step signals.



sawtooth pulse

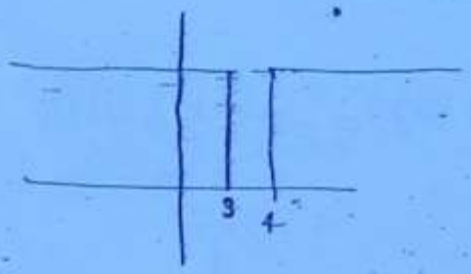
$f(t) = r(t+3) - u(t-4) + r(t-4)$

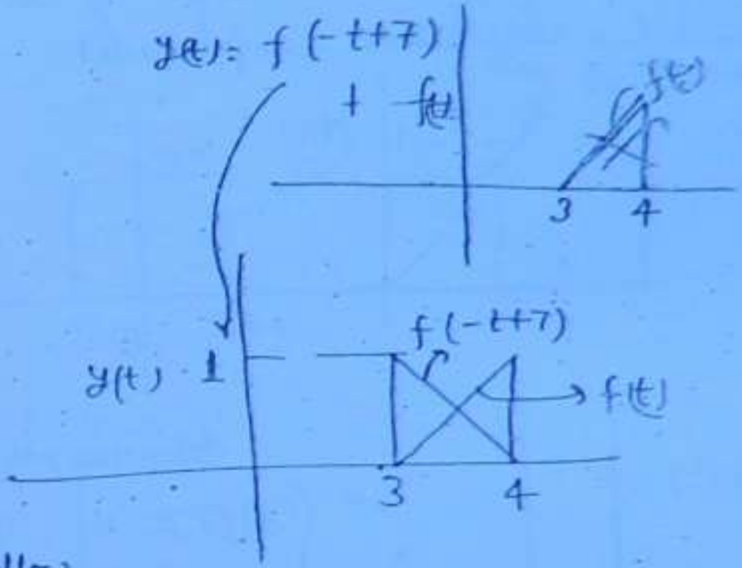
$r(t+3)[u(t-3) - u(t-4)]$

(ii) for the above signal $f(t) + f(-t+7)$ will be

$$f(t) + f(-t+7) = r(t-3) - r(t-4) - u(t-4) + r(-t+4) - r(-t+3) - u(-t+3)$$

=



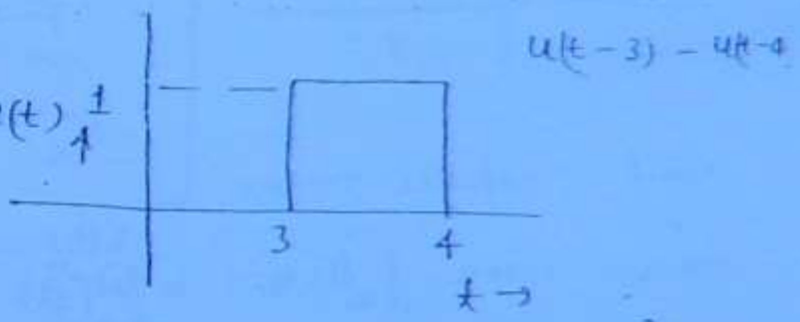


If shifting and reversal operation both involved in given transformation the normal order we follow shifting first and then reversing but we can also do this process in reverse order.

$f(-t+7)$ reverse order

$$f(t) \xrightarrow{\text{reversal}} f(-t)$$

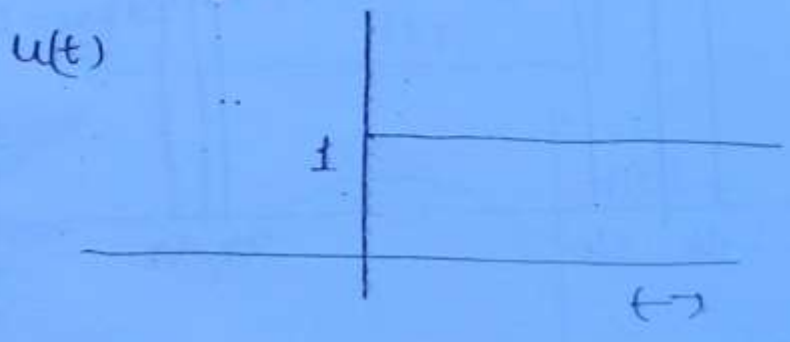
$$\text{shift} \xrightarrow[\text{delayed}]{\text{by } 7} f(-t+7)$$

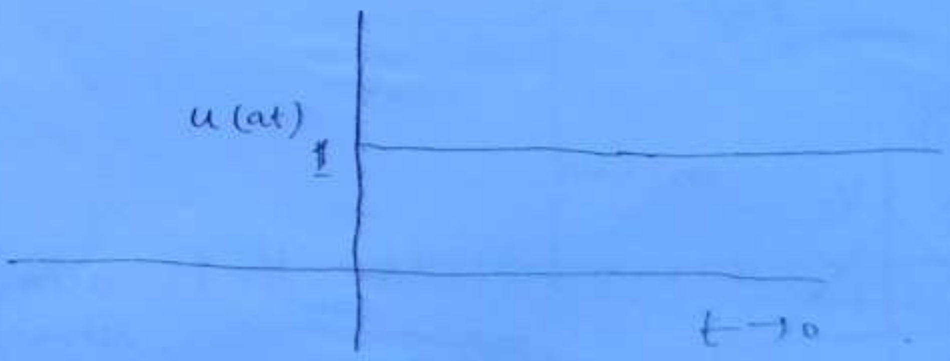


$f((-)[t-7])$

$f(at+b)$

$f(a[t+b/a])$

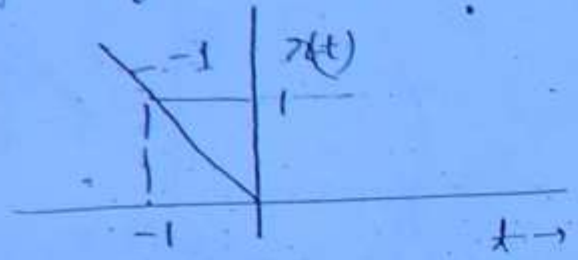




$x_1(at) = \begin{cases} at & at \geq 0 \\ 0 & at < 0 \end{cases} \longrightarrow \begin{Bmatrix} a > 0 \\ \end{Bmatrix}$

$x(at) = a\, x(t)$

* in ramp signal scaling of time results in scaling of magnitude (amplitude).



$x(-t) = \begin{cases} -t & t \leq 0 \\ 0 & t > 0 \end{cases}$

definition of delta function

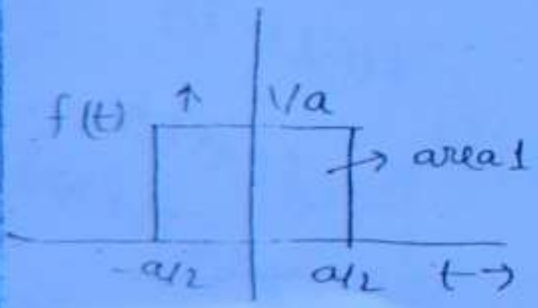
$$\begin{cases} \delta(t) = 0 & t \neq 0 \\ \quad\; \neq 0 & t = 0 \\ \int_{-\infty}^{\infty} \delta(t)\, dt = 1 \end{cases}$$

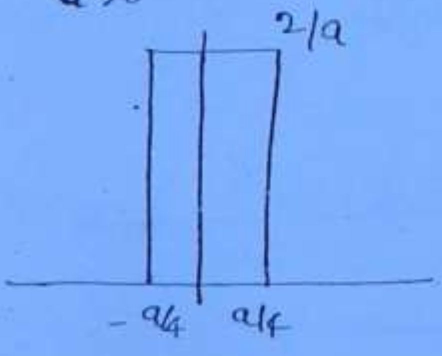
also called dirac delta function.

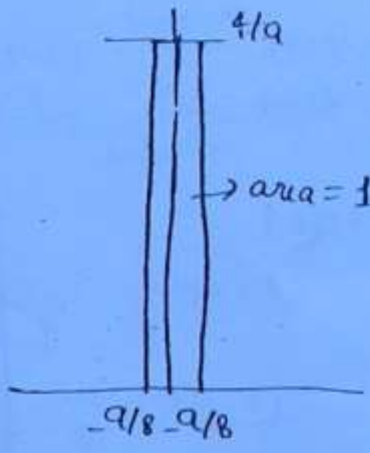
unit impulse means
↓
means area $\int_{-\infty}^{\infty} \delta(t) dt = 1$

$\delta(t) = \lim_{a \to 0} f(t)$

$= \lim_{a \to 0} f''(t)$

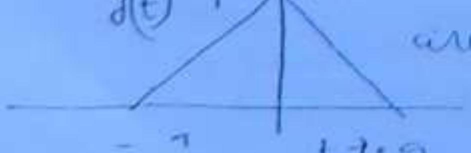






$a \to 0$ hight $\to \infty$

or

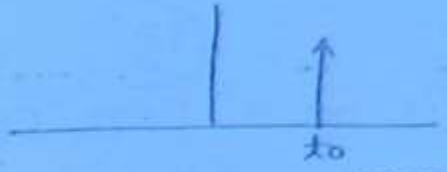


area = 1

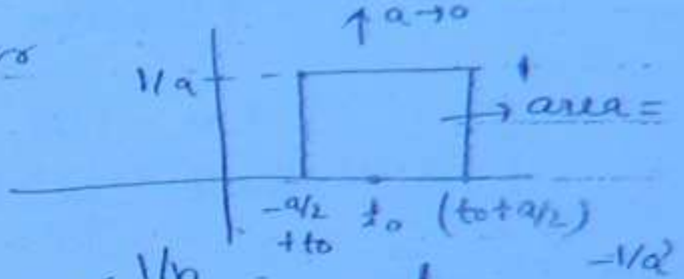
$a \downarrow$ $1/a \uparrow$ area remain same

$\delta(t) = \lim_{a \to 0} g(t)$

$\delta(t-t_0) = \lim_{a \to 0} f(t-t_0) =$



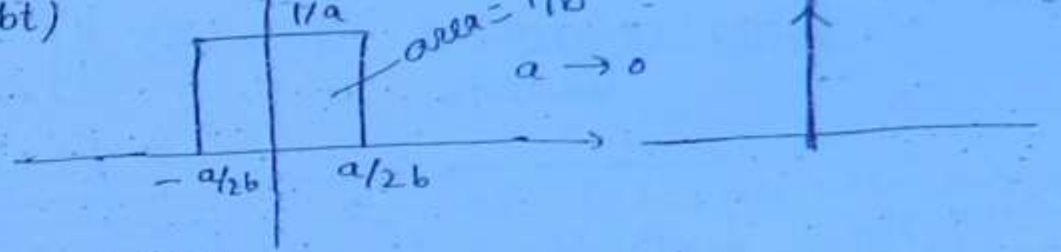
or



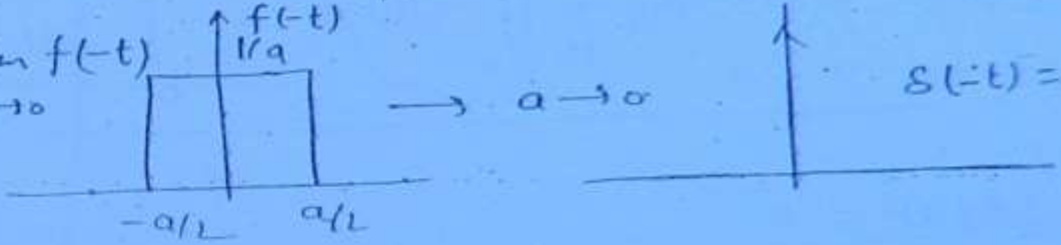
$\delta(bt) = \lim_{a \to 0} f(bt)$

$\frac{1}{b}\delta(t)$

$= 1/b\, \delta(t)$



$\delta(-t) = \lim_{a \to 0} f(-t)$

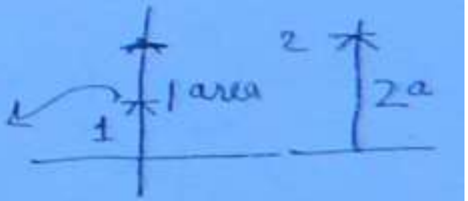


$\delta(-t) = \delta(t)$

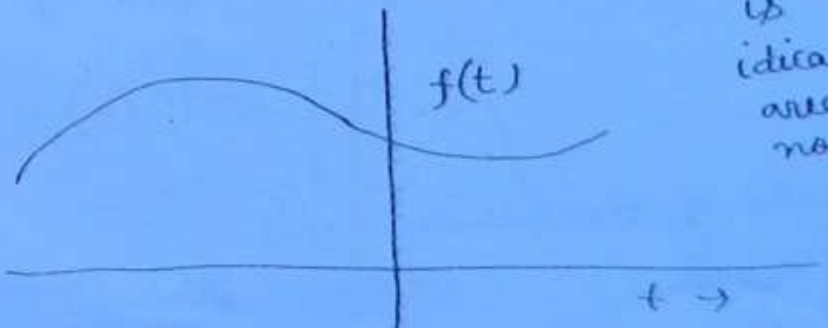
$\delta(-2t) = \frac{1}{2}\,\delta(t)$

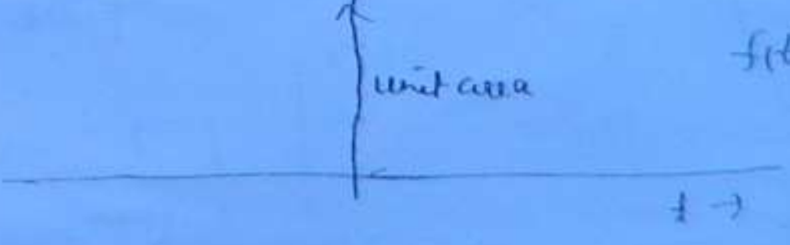
$\delta(-2t) = \delta(2t) = 1/2\, \delta(t)$

$$\boxed{\delta(bt) = \frac{1}{|b|}\,\delta(t)}$$



height is idicating area not the value





$f(t)\cdot\delta(t) = f(0)\cdot\delta(t) = \delta(t)$ (If $f(0) > 0$, [illegible]

$$f(t)\,\delta(t-a) = \overbrace{f(a)\cdot\delta(t-a)}^{\text{amplitude } \infty \text{ but effect on area}}$$

area will become $= f(a)$, b/w ($-\infty$ to ∞) curve

$$= f(a)\cdot\delta(t-a)$$

→ sampling Property of impulse signal.

$$\int_{-\infty}^{\infty} f(t)\,\cancel{dt}\,\delta(t)\,dt = f(0)\int_{-\infty}^{\infty}\delta(t)\,dt = f(0)$$

$$\int_{-\infty}^{\infty} f(t)\,\delta(t-a)\,dt = f(a) = \int_{\infty}^{\infty} f(a)\,\delta(t-a)\,dt$$

$$= f(a)\int_{-\infty}^{\infty}\delta(t-a)\,dt = f(a)$$

$$\boxed{\int_{-\infty}^{\infty}\delta(t)\,dt = \int_{-1}^{1}\delta(t)\,dt = \int_{-a}^{a}\delta(t)\,dt = \int_{0^-}^{0^+}\delta(t) = 1}$$

$$\int_{1}^{2}\delta(t)\,dt = 0$$

calculate following → (i) $\int_{-\infty}^{\infty} \cancel{\delta(t-}\ \sin(t-\pi)\ \delta(t-\pi/2)\,dt$

$$= \sin(\pi/2-\pi) = \sin(-\pi/2)$$

$$= -\sin\pi/2 = -1$$

Q $\int_{-\infty}^{\infty}\sin(t-\pi)\ \delta(3t-\pi/2)\,dt = \frac{1}{3}\sin(\pi/6-\pi)$

$$= +\frac{1}{3}\sin(-\pi/6)$$

$$= -1/6$$

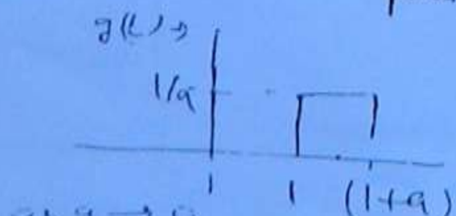
Q-(i) Find the value of the following integral.

$$\int_{-\infty}^{\infty}\frac{\sin(\pi t-\pi/2)}{(t^2+4)}\,g(t)\,dt$$

where $g(t)$ is following pulse -

(ii)

$$= \frac{\sin\pi/2}{5} = 1/5$$



as $a \to 0$

as $a \to 0$

$$= \cancel{(1+a/2)}\quad\delta(t-1)$$

15th oct 10

differentiation →

$f(t)\ ,\quad \frac{df(t)}{dt}$

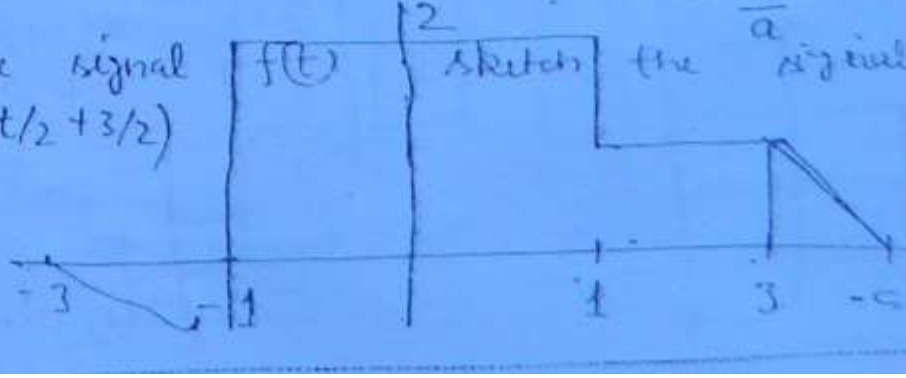
$$\int_{-\infty}^{t} \overbrace{e^{at} u(-t)}^{\text{managable}} dt = \int_{-\infty}^{0} e^{at} dt = \frac{1}{a} \left[e^{at} \right]_{-\infty}^{0}$$

$$= \frac{1}{a}$$

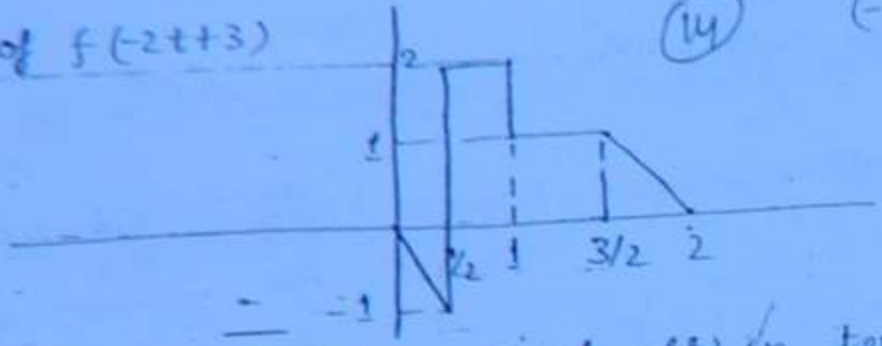
for above signal f(t) sketch the signal ~~f(t/3)~~ $f(-t/2 + 3/2)$



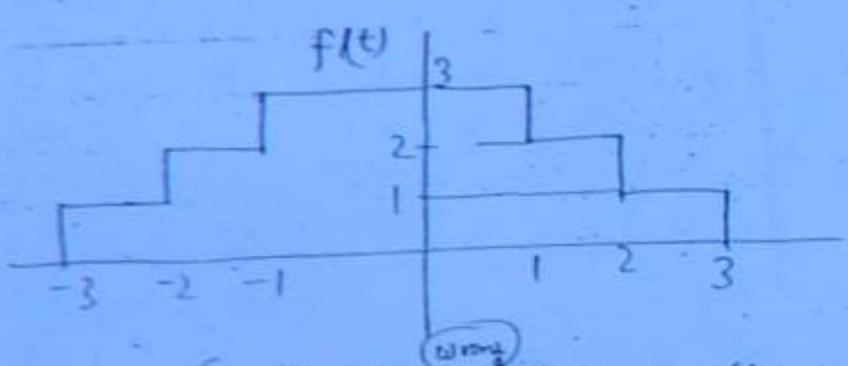
graph of $f(-2t+3)$ ⑭

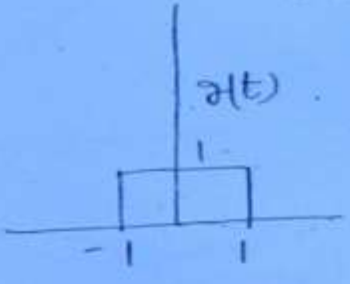
$(-2t+3) = t_1$

$t = -t_1/2 + 3/2$



Q. Represent the following signal $f(t)$ in terms of $g(t)$



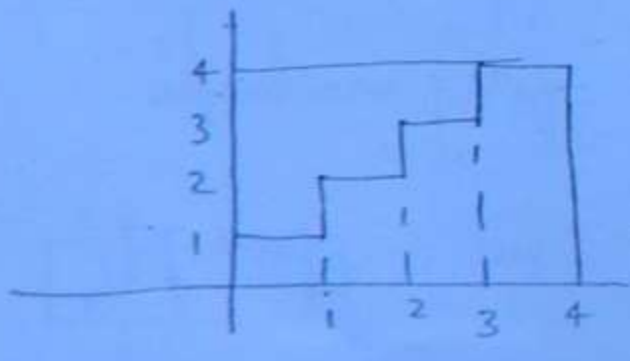


$$f(t) = \{ g[t+2] + \overset{\text{wrong}}{g(t+1)} + g(t) + g(t-2) - g(t-3) - g(t-4) \}$$

$$f(t) = g(t/3) + g(t/2) + g(t)$$

Q. represent the following signal $f(t)$ in terms of $g(t)$

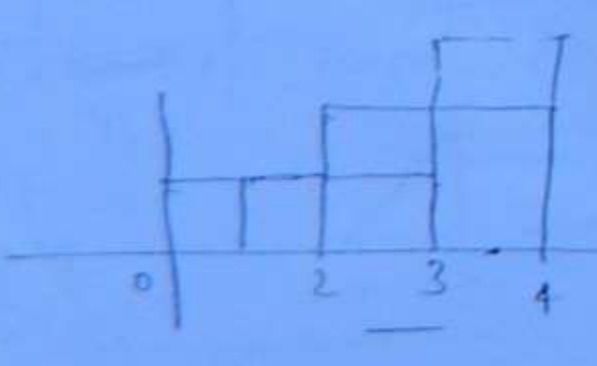
$g(t)$ is same in previous question

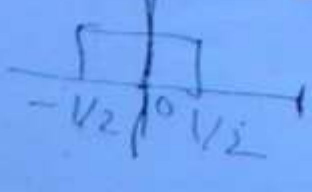


$g(t-1) + g(t-2) + 2g(t-3)$
$+$ ~~$2g(t-4)$~~
$+ 2g[2(t-7/2)]$

Ans –

$f(t) = g(t-1) + g(t-2)$
$+ 2g(t-3)$
$+ 2g[2t-7]$



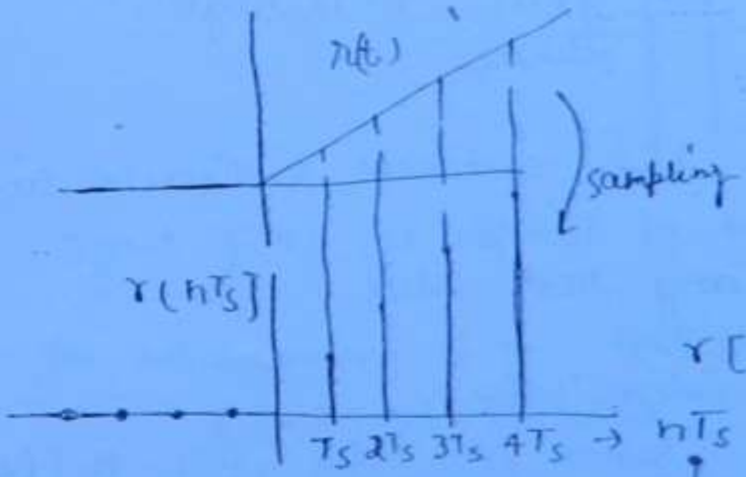


15

Types of signal →
can be real value signal or complex value signal
$f(t) = at$ real valued
$f(t) = at + ibt$ complex valued

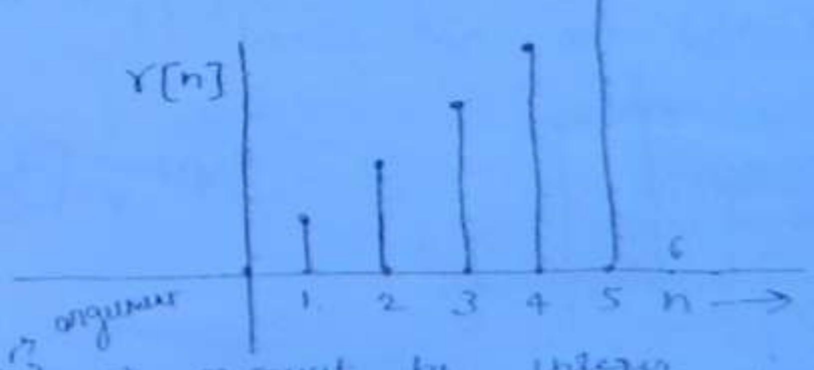
$e^{jt} = \cos t + j\sin t$ Euler's identity
* Signals having only real value they are called as real valued signal $f(t) = \cos t, \sin t$, real valued signal
* Signals having imaginary value along with real value are defined as complex valued signal.
  eg. $e^{jt} = \cos t + j\sin t$
  real part = $\cos t$, imaginary part = $\sin t$

Continuous time & discrete time signal →
* Continuous time signals are those signal having def value for every real value of time.



discrete time signals are those signals having defined values at some fixed insta and at other instant undefined.

take $T_s = 1$



$f[\overset{\text{argument}}{n}]$ → n must be integer, $f(t)$ ↳ any real value
discrete time signal

$$f[n] = \{-1, \underset{\uparrow}{\overset{n=0}{1}}, 2, -2\}$$

$-1 \Rightarrow n=-1$
$1 \quad n=0$
$2 \quad n=1$
$-2 \quad n=2$
0 otherwise other values of n.

* Continuous time signal is that signal which is defined for all values of time.

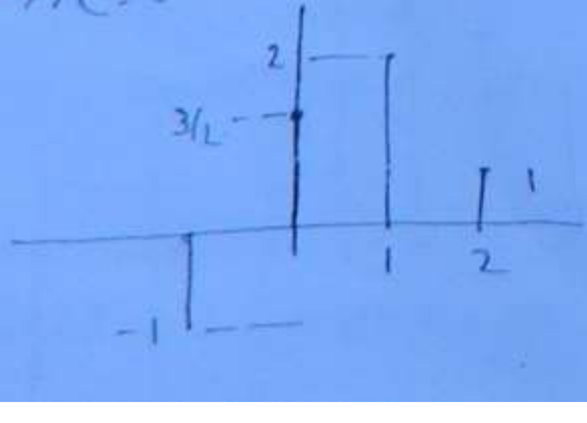
* A discrete time signal is a signal which is defined only for specific values of time. It is not defined for other values of time. a discrete time signal is derived from a continuous time signal by a procedure called as uniform sampling and then selecting uniform sampling interval value to be 1.

$f(t) \mapsto f[nT_s] \rightarrow T_s=1 \rightarrow \underset{\text{discrete}}{f(n)}$ n is integer.
continuous

Fundamental difference b/w continuous & discrete time signal is $f(t)$
↳ t can be any real value
$f(n)$
↳ n → only integer value.

* For a discrete time signal $f(n)$, value like $f(4/3)$, $f(5/6)$, & $f(-2/3)$ are not defined.

an eg →

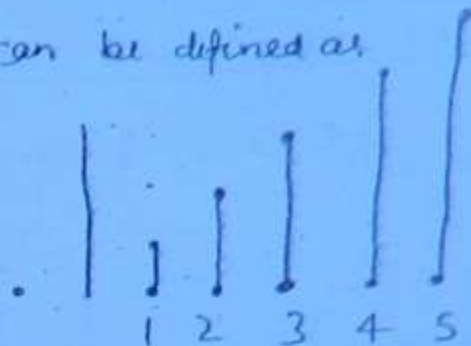


$$f(n) = \{-1, \overset{n=0}{3/2}, 2, 1\}$$

(17)

discrete time ramp signal can be defined as

$x(n) = n \quad n \geq 0$
$\quad\quad 0 \quad$ otherwise



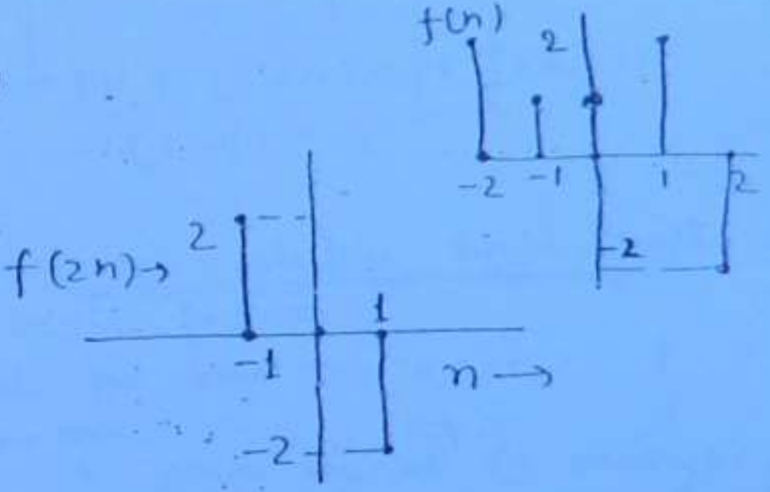
strictly

- n-axis discrete
amplitude axis is continuous.

but we can't it for. even continue

$f(n) \xrightarrow{n \to n-3} f(n-3)$

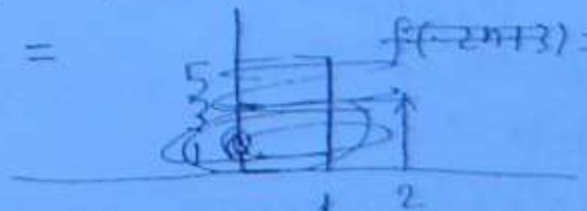
$f(2n) \longrightarrow$



Q. Signal $f(n)$ is defined to be $f(n) = \{1, 2, \underset{\uparrow}{3}, 4, 5\}$

for what values of n will the signal
$f[-2n+3]$ be zero
$f[-2(n-3/2)]$

- at $n = 0, -2, -4, \ldots, +2, 4 \ldots$
- $f[-2n+3] =$



~~$f(-2n+3) = \{1, 5, 3\}$~~

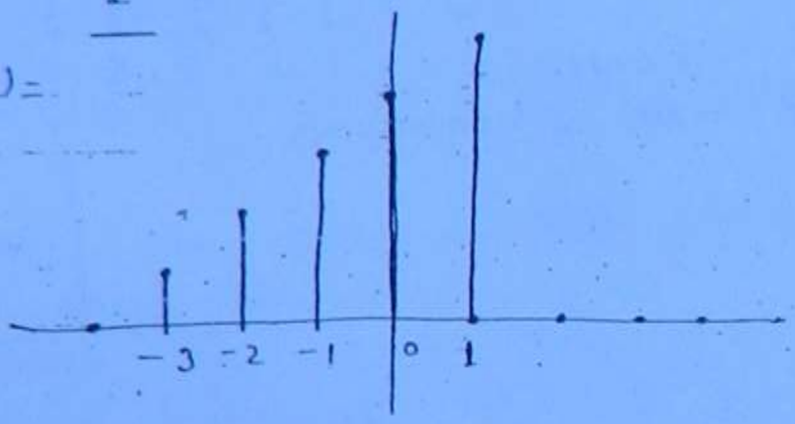
$f(-2n+3) = \{\underset{\uparrow}{0}, 5, 3, 1\}$ 0 for $n \leq 0$ and 0 $n > 3$

(18)

discrete time unit step signal :→

$$u[n] = \begin{cases} 1 & n \geq 0 \\ 0 & n < 0 \end{cases}$$

$f(n) =$



$$f(n) = u[n+3] + u[n+2] + u[n+1] + u[n] + u[n-1] - 5\,u[n-2].$$

discrete time Unit impulse function →

area of $\delta(t) = 1$

$$\delta[n] = \begin{cases} 1 & n = 0 \\ 0 & n \neq 0 \end{cases}$$

→ by defining value 1 we are making it managable.

17th oct 10:

$$\delta[n] = u[n] - u[n-1]$$

$$\delta(t) = \frac{du(t)}{dt}$$

$$u[n] = \sum_{0}^{\infty} \delta[n-K]$$

$$u(t) = \int_{-\infty}^{t} \delta(t)\,dt$$

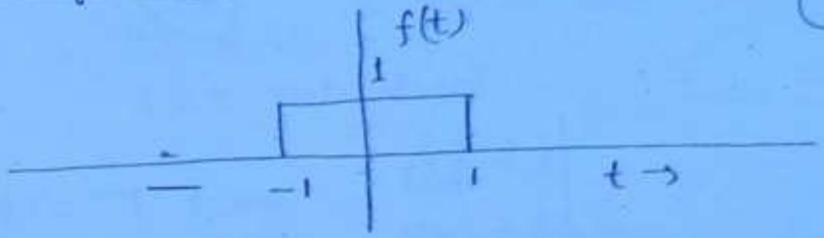
$$u[n] = \sum_{K=-\infty}^{n} \delta(K]$$

~~r[n]~~ =

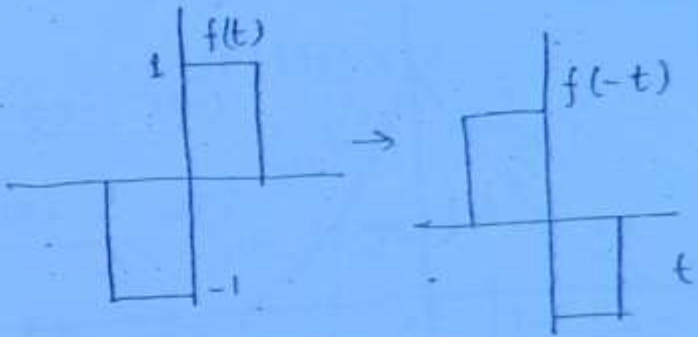
$$\boxed{u[n] = r[n] - r[n-1]}$$

$$r(n) = \int_{-\infty} \sum_{k=-\infty}^{n} u[K]$$

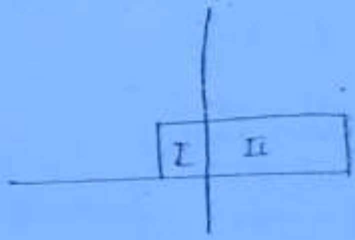
Even signal or odd signals :



$f(-t) = f(t)$ even signal.
or symmetrical signals



$= -f(t)$
odd signal
or antisymmetric signal.

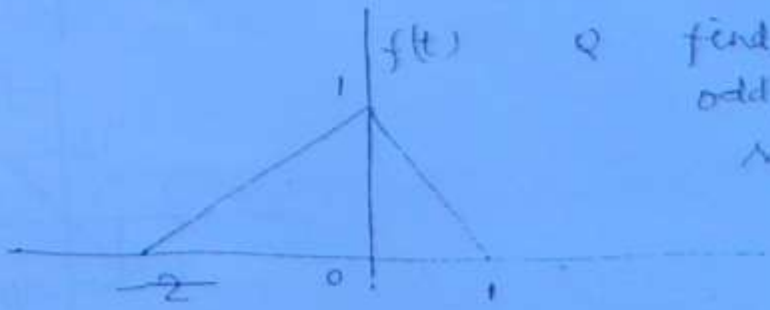


neither even nor odd signal

$f(t) + f(-t) \rightarrow$ even signal (always)
$f(t) - f(-t) \rightarrow$ odd signal.

$f(t) = \frac{1}{2}[$ even signal + odd signal $]$
even part of f(t) odd part of f(t).

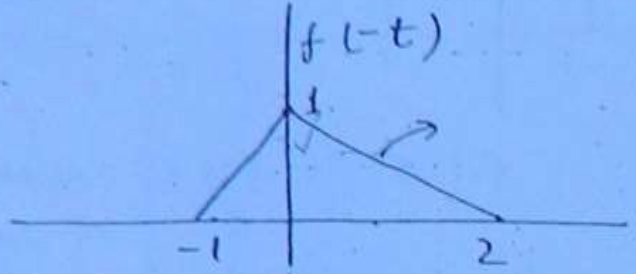
$\cos(t) = \cos(-t) \rightarrow$ even signal or symmetrical signal
$\sin(t) = -\sin(-t) \rightarrow$ odd signal or antisymmetrical signal
(opposite symmet

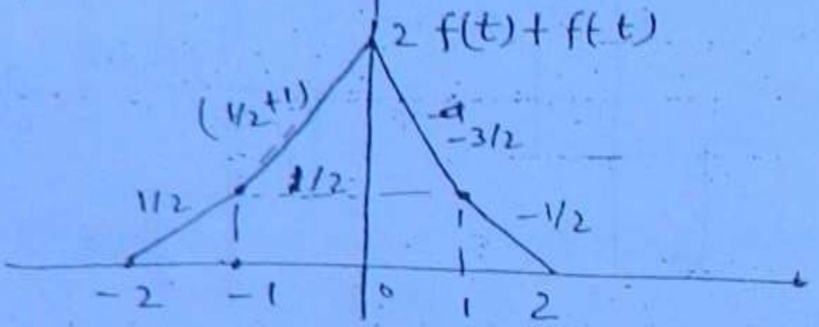


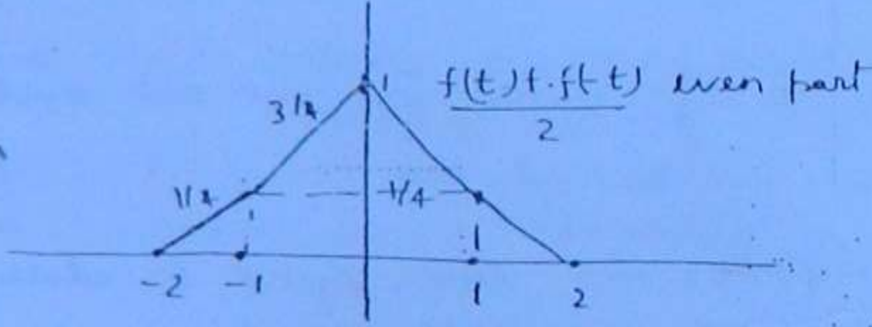
Q find the even and odd part of following signal f(t).

even part = $\frac{1}{2}[f(t) + f(-t)]$

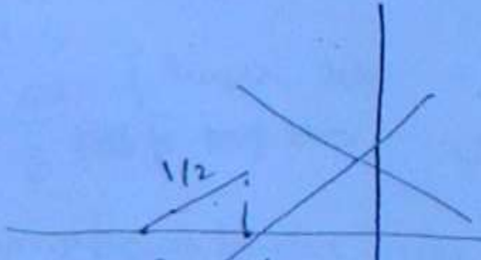
=

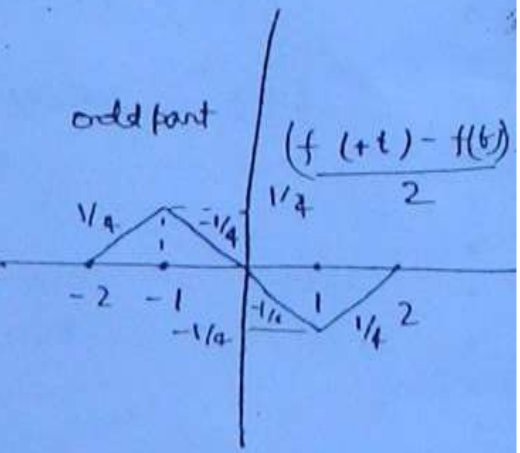


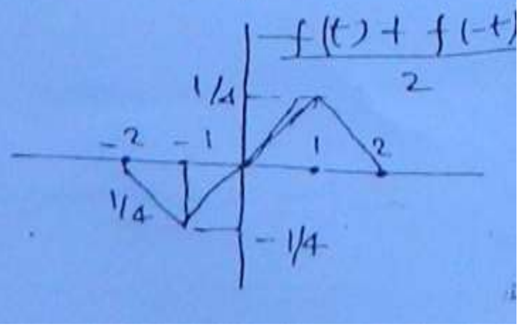




odd part

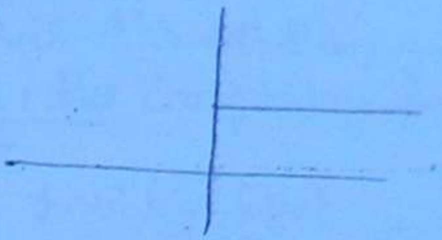




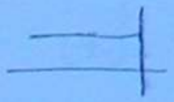


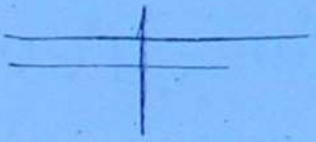
$\frac{1}{2}[u(t) + u(-t)]$

$u(t) = 1 \quad t > 0$
$\quad\quad 0 \quad t < 0$
$\quad\quad t = 0$ not defined.



$u(t) = 1 \quad t > 0$ take
$\quad\quad 0 \quad t < 0$ any definition.
$\quad\quad 1/2 \quad t = 0$



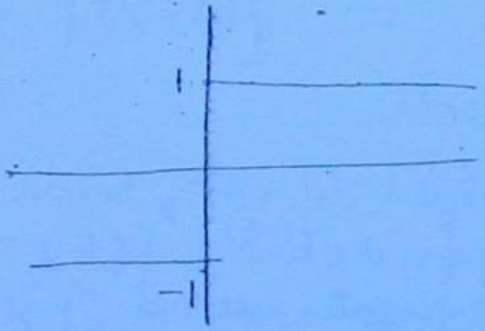


$$u_e(t) = \frac{u(t) + u(-t)}{2} = 1/2$$

$$u_o(t) = \frac{u(t) - u(-t)}{2} = \frac{1}{2} sgn(t)$$

$sgn(t) = 1 \quad t > 0$
$\quad\quad -1 \quad t < 0$

four definition any we can take
$t = 0$ undefined
or 1
or -1
or $= 0$



Q. find even and odd part of $f(t) = \sin(t)\, u(t)$

$f(t) = e^{jt} = \cos t + j\sin t$

$f_e(t) = \frac{e^{jt}+e^{-jt}}{2} = \cos t$

$f_o(t) = j\sin t$

$f(t), f^*(t)$

⊛ $f(t) = f^*(-t)$ even conjugate signal
conjugate symmetric signal

$f(t) = -f^*(-t)$ odd conjugate signal
or conjugate antisymmetric signal

e^{jt} → even conjugate signal

$f(t) = f^*(-t)$

$= [e^{j(-t)}]^* = e^{(-j)(-t)} = e^{jt}$

$f(t) = je^{jt}$

$-f^*(-t)$

$-[je^{j(-t)}]^* = -[-je^{jt}] = je^{jt}$

odd conjugate signal

$f(t) = e^{jt} = \underset{\text{even}}{\underset{\downarrow}{\underline{\cos t}}} + j\,\underset{\text{odd}}{\underset{\downarrow}{\underline{\sin t}}}$

* for an even conjugate signal

Real part [f(t)] = even part of f(t) → even in nature

odd part [f(t)] = ~~odd~~ imaginary part of f(t)

$je^{jt} = \underset{\text{odd}}{\underset{\downarrow}{-\sin t}} + j\,\underset{\text{even}}{\underset{\downarrow}{\cos t}}$

(1) for a complex valued signal which is even conjugate in nature real part is always even and imaginary part is always odd.

(*) For a complex valued signal which is odd conjugate in nature real part is always odd and imaginary part is always even.

$f(t) = f_{ec}(t) + f_{oc}(t)$. (23)

$f^*(t) = f^*_{ec}(t) + f^*_{oc}(t)$

$f^*(-t) = f^*_{ec}(t) + f^*_{oc}(-t)$

$= f_{ec}(t) - f_{oc}(t)$

$f_{ec}(t) = \frac{1}{2}[f(t) + f^*(-t)]$

$f_{oc}(t) = \frac{1}{2}[f(t) - f^*(-t)]$

J

Q If signal $f(t) = e^{j2t}$ energy signal or power signal
power signal periodic signal

Power = 1

in calculation of power or energy we concentrate on amplitude not on phase.

in case of discrete time signals

$$E = \sum_{n=-\infty}^{\infty} |f[n]|^2$$

$$P = \lim_{N\to\infty} \frac{1}{2N} \sum_{n=-N}^{N} |f[n]|^2$$

Find energy in the even conjugate part of the signal.

$$x[n] = \left\{ -4-j5 \quad \underset{\uparrow}{1+j2} \quad 4 \right\}$$

$$x_{ec}[n] = \frac{x[n] + x^*[-n]}{2}$$

$$= \left\{ -2.5j \quad \underset{\uparrow}{1} \quad 2.5j \right\}$$

$$\therefore \quad E_{ec} = 1 + (2.5)^2 + (2.5)^2$$

$$= 1 + 6.25 + 6.25$$

$$= 13.5 \text{ J}$$

$$\int_{-\infty}^{\infty} f^2(t)\, dt = \int_{-\infty}^{\infty} [f_e(t) + f_o(t)]^2 dt$$

$$= \int_{-\infty}^{\infty} f_e^2(t)\, dt + \int_{-\infty}^{\infty} f_o^2(t)\, dt + 2 \underbrace{\int_{-\infty}^{\infty} f_e(t)\, f_o(t}_{\text{odd sign}}$$

$$= E_e + E_o + 0$$

$$\boxed{E = E_e + E_o}$$

Causal or Non Causal signal

↳ the signal which not start before zero

If signal start before zero then it is a non causal signal. (all periodic signals are non causal)

Deterministic or Random signal :

* A signal which can be defined by well defined mathematical expresion, it is called as deterministic signal.

* A signal for which we can't give a well define mathematical expresion is defined as a random signal.

Bounded or unbounded signal →

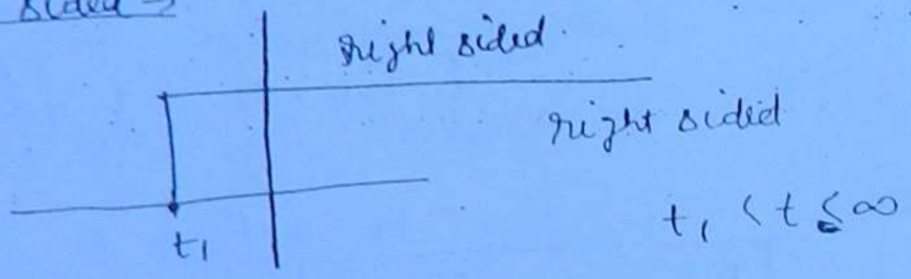
* If the amplitude of signal have some finite boundaries for all values of time it is called as bounded signal

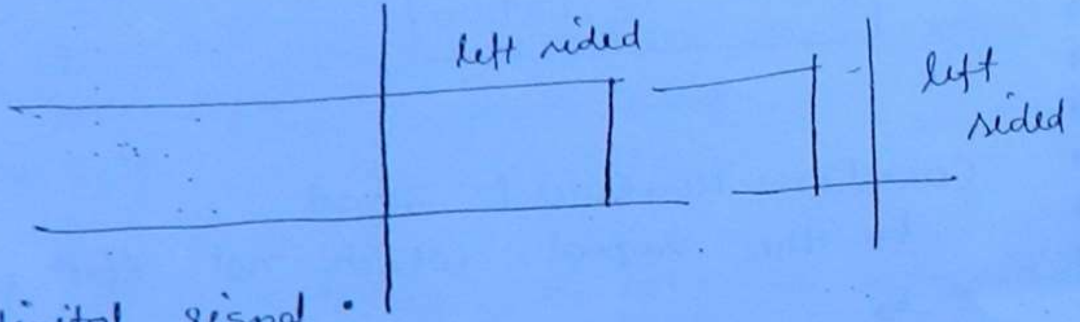
$$\left.\begin{aligned} &— |f(t)| < \infty \\ &|f(t)| < M \rightarrow \text{finite} \end{aligned}\right\} \text{for all } t, \text{ bounded signal}$$

if signal value become infinite for any value of time, it is called as unbounded signal.

Right sided or Left sided →

—





Analog or digital signal :

* A signal which can assume infinite no. of values for ~~its~~ amplitude is defined as analog signal.
* If a signal is allowed only to assume finite no of amplitude then the corresponding signal is a digital signal. A digital signal is that signal which ~~discre~~ may discrete in both on time axis & amplitude axis.

$f(t)\, u(-t) = 0$

$f(t)$

Match the following : ③/

List - I

expression of $f(t)$

A. $f(t)[1 - u(+t)] = 0$

B. $f(t) + K \frac{d f(t)}{dt} = 0$ {(K = +ve)

C. $f(t) + K \frac{d^2 f(t)}{dt^2} = 0$ ⟶

D. $f(t)[g(t) - g(0)] = 0$
arbitrary $g(t)$

List - II

nature of $f(t)$

(i) Increasing exponential

(ii) Causal signal

(iii) decreasing exponential

(iv) Sinusoidal

(V) Simpulse

$A \to f(t) = f(t)\, u(t)$

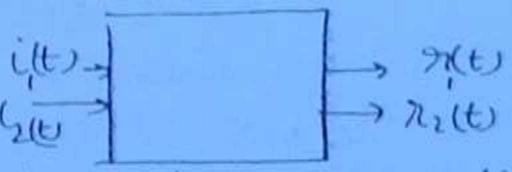
$t < 0$

$f(t) = 0$

$f(t)\, g(t) = f(t)\, g(0)$

C → (iv)
B → (iii),
A → (ii)
D → (V)

System :



⊛ A system is a quantity which maps a set of i/P signals to a set of a O/P signals

we can understand (or represent) a system by

(i) i/P – O/P relationship.

(ii) Physical composition → (NE, ECD, AE, DE)

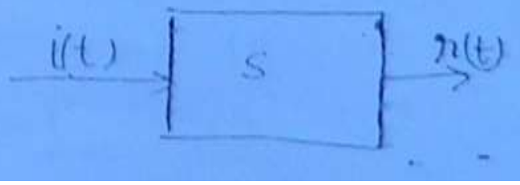
(iii) differential equation or difference equations.

(iv) Unit impulse response $h(t)$, $h[n]$

(V). Transfer function $H(\omega)$, $H(S)$, $H(z)$

(VI) State variable

$V = L \frac{di}{dt}$
$i = C \frac{dv}{dt}$
our
[illegible] constraints



$i(t) \xrightarrow{S} r(t)$

Linear system or Nonlinear system.

where a is a real or imaginary quantity a constant

$i(t) \xrightarrow{S} r(t)$

$a\,i(t) \xrightarrow{S} a\,r(t)$ homoginity principle [like 2 or 2j]

$i_1(t) \xrightarrow{S} r_1(t)$

$i_2(t) \xrightarrow{S} r_2(t)$, $\Big\}$ $i_1(t)+i_2(t) \xrightarrow{S} r_1(t)+r_2(t)$ superposition principle or additivity principle

$a\,i_1(t) + b\,i_2(t) \xrightarrow{S} a\,r_1(t) + b\,r_2(t)$

Linearity principle.

⊛ A system satisfying both homoginity & superposition principle then it is said to linear system. If it can not satisfy one of these principle or both, it is defined as non linear system.

$r(t) = 2i(t)+3$ → not linear

$r(t) = \log i(t)$ → not linear

$r(t) = i^2(t)$ → non linear

$r(t) = t\,i(t)$ → linear

$r(t) = \sin t\, i(t)$ → linear

$r(t) = \int_{-\infty}^{t} i(t)d\tau$ → linear /

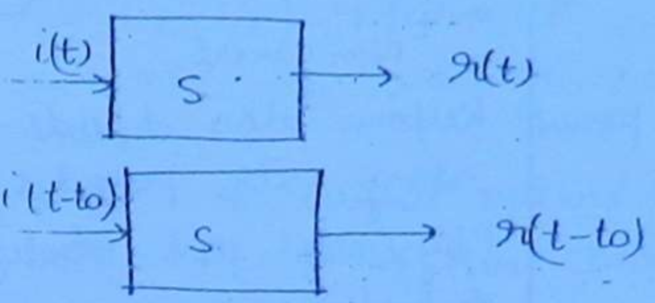
$r(t) = \int_{-5}^{5} i(t)\,d\tau$ → linear

✓ $r(t)$ = real part of $\{i(t)\}$ not linear.

it does not hold homoginity for an $a = jb$ } real /

imaginary $a\,i(t)$ will not be $a\,r(t)$. non linear

Time varient or time invarient :→



time invarient system.

* The system is defined as time invarient system if the response is delayed by the same amount as delay given to the system.

19th oct 10

* If response to $i(t-t_0)$ is not equal to $r(t-t_0)$, system is called as time varient system

$r(t) = i(-t)$ $\qquad$ $r(t-t_0) \rightarrow i(-t+t_0)$

$r_1(t-t_0) \rightarrow r_1[-t-t_0]$

$\downarrow$

$r(t) = \int_{-5}^{5}$

T.V

$r(t) = i($

⊛ Causal system & Non Causal system →

Cause → Causal

	Causal	Non causal
(i)	response depends upon present & past i/ps	Response also depends on future along with present & past i/ps
(ii)	Physically realizable	Physically not realizable.
(iii)	Nonanticipatory	Anticipatory

* Non causal system also become physically realizable when the data which is being operated upon or when the i/p data is recorded data. But by default we consider data to be real time data and hence only causal systems are physically realizable systems.

$i(t) \qquad i(t-t_0) \qquad i(t+t_0)$

$i=0 \quad i(0) \qquad i(-t_0) \qquad i(t_0)$

$$r(t) = f[i(t), i(t-t_0)]$$

$$r(t) = f[i(t-t_0)]$$

$$t_0 \geq 0$$

* $r(t) = i(-t)$

non causal

$r(1) = i(-1)$

$r(-1) = i(1) \xrightarrow{\text{depend}}$ future i/p

$r(t) = i(t) + i(t-2) + i(t-4) \rightarrow$ causal system.

$r(t) = i(2t) \rightarrow$ non causal system

$r(1/2) = i(1)$

$r(t) = i(1/2\, t)$ – non causal

$r(-1) = i(-1/2) \rightarrow$ future i/p

(*) $r(t) = i(at) \longrightarrow$ always non causal

$r(t) = i^2(t) \rightarrow$ causal system

$r(t) = i(t^2) \longrightarrow$ non causal

$r(t) = i(\sin t) \longrightarrow$ non causal

$r(\pi/2) = i(1)$

$r(-\pi/2) = i(-1) \longrightarrow$ future i/p.

$r(\pi) = i(\sin\pi) = i(0)$

$r(-\pi) = i(0)$

* Systems can be static or dynamic

If there is no arrangement for memory in an electrical system, it is called as static system

If there is arrangement of memory in electrical system, it is called as dynamic system

$r(t) = i^2(t)$ – static system

or $\log i(t)$, $t\, i(t)$

$\sin t\, i(t)$

$2\, i(t) + 3$

$A \cdot i(t)$ } – Linear, static, time invarient)

* For a static system to be linear & time invarient only way the response can be related to i/p is $r(t) = A\, i(t)$

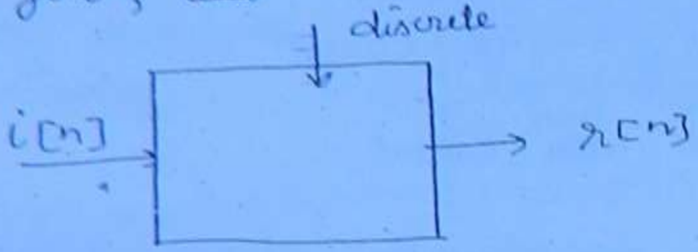
Stable or unstable system :→

<u>BIBO</u> stability

$|i(t)| < M$

$|r(t)| \leq N$

* A system can become noninvertible in following cases
(i) if more than one i/P to system is generating the same response for the system.
(ii) if the response of the system to a nonzero i/P is zero; ~~and~~



- verify whether ~~is~~ ~~this~~ following discrete time system is linear, time invarient, causal, static stable, invertible.

$$r[n] = \sum_{k=-\infty}^{n} i[k] \rightarrow \text{accumulator}$$

↓ linear, time invarient, causal, dynamic, unstable, invertible

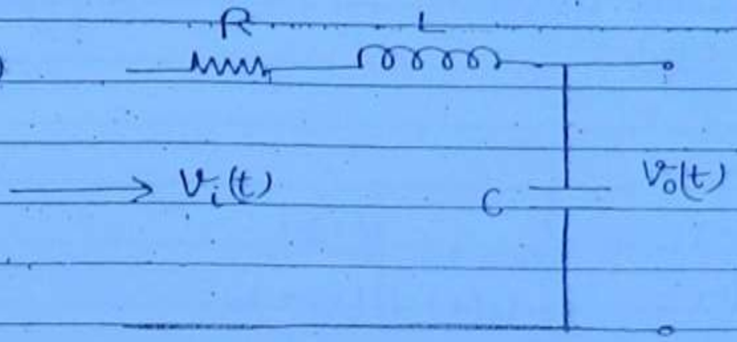
$|\beta| > 1$ ✓

⊗



$$LC \frac{d^2 v_0}{dt^2} + RC \frac{dv_0}{dt} + v_0(t) = v_i(t)$$

(*) A system is general can be represented by a differential eqn given below

$$a_2 \frac{d^2 y}{dt^2} + a_1 \frac{dy}{dt} + a_0 y = b_1 \frac{dx}{dt} + b_0 x(t)$$

In above differential eqn there are no product terms of the i/p $x(t)$ or ~~of~~ o/p $y(t)$ are their darivatives i.e. there are no terms like $x^2(t)$, $x^3(t)$, $\left(\frac{dy}{dt}\right)^2$ $\left(\frac{d^2}{d}\right.$ $\left(\frac{dx}{dt}\right)^2$, $\left(\frac{d^2x}{dt^2}\right)^2$, $[y(t)]^2$, $\left(\frac{dx}{dt}\frac{d^2x}{dt^2}\right)$ ----

such a differential equation is called a linear differential and it directly corresponds to a linear system. In ~~the~~

(*) In the above differential eqn if all the coefficients a_2, a_1, a_0, b_1, b_0 are ~~const~~ independent of time (i.e. constants) then the above differential eqn can be called as a constant coefficient differential eqn and it directly corresponds to time invariant system

Q. A system represented by following differential eqⁿ

$$2\cdot\frac{d^2y}{dt^2} + 4\frac{dy}{dt} + 8t\ y(t) = 2\ x(t)$$

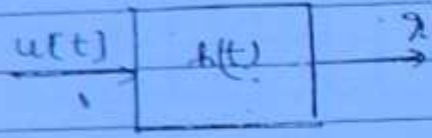
linear but time varient

$$2\frac{d^2y}{dt^2} + 4\frac{dy}{dt} + 2y^2(t) = 2x(t)$$

Non linear, but time invarient

$$2\frac{d^2y}{dt^2} + \sin t\cdot\frac{dy}{dt} + y(t) = 2x(t)$$

linear, time varient



$$x(t) = \int_{-\infty}^{\infty} u(\tau)\ h(t-\tau)d\tau$$

$$= \int_{-\infty}^{\infty} h(\tau)\ u(t-\tau)d\tau$$

$$x(t) = \int_{-\infty}^{t} h(\tau)\ d\tau$$

$$u(t) = \int_{-\infty}^{t} \delta(\tau)d\tau$$

∴ system is linear

∴ response to $u(t)$ $x(t) = \int_{-\infty}^{t} h(\tau)d\tau$

$$h(t) = \frac{d\ x(t)}{dt} = \frac{d\ S(t)}{dt}$$

S(t) is step response

Q. The following four signal define step responses & impulse responses of continuous time LTI systems

(i) $(5-4e^{-2t})\ u(t)$

(ii) $(4-3e^{-2t})\ u(t)$

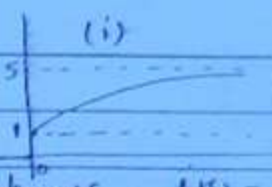
(iii) $5\delta(t) + 8e^{2t}u(t)$

(iv) $2\delta(t) + 6e^{-2t}\ u(t)$

of this which two signals corresponds to step response & impulse of the same LTI system

Ans

(i) & (iii)



(i) step response

(iii) is impulse response. $h(t) = 5\delta(t)+(8e^{-2t}u(t))$

$s(t) = \int h(\tau)d\tau = 5u(t) + \int_0^t 8e^{-2\tau}u(\tau)d\tau$

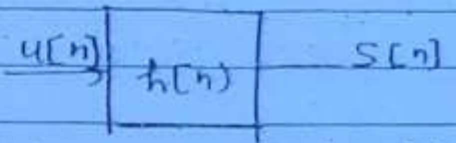
$= 5u(t) + 8\int_0^t e^{-2\tau}d\tau$

$= 5u(t) - 4(e^{-2t} - 1)$

$S(t) = (5-4e^{-2t})\, u(t)$

$h(t) = \frac{ds(t)}{dt} = 5\delta(t) - 4\delta(t) + 8e^{-2t}u(t)$

$= \delta(t) + 8e^{-2t}u(t)$



$h[n] = S[n] - S[n-1]$

impulse response → S[n] step response

$S(n) = \sum_{K=-\infty}^{n} 6\, h[n]$

Q. For a discrete time system, the response to a step i/p is known to $S[n]\{1, \underset{\uparrow}{2}, 1\}$ find ~~h[n]~~ response of the system for f[n] $= \{\underset{\uparrow}{1}, 2,$

$S[n-1] = \{\underset{\uparrow}{1}, 2, 1\}$

$h[n] = S[n] - S[n-1] = \{1, \underset{\uparrow}{1}, -1, -1\}$

↑ impulse response

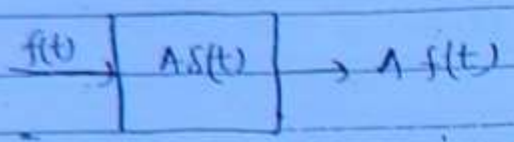
$f[n] = \{\underset{\uparrow}{1}, 2, 3\}$

	1	1	-1	-1
1	1	1	-1	-1
2	2	2	-2	-2
3	3	3	-3	-3

$r[n] = \{1, \underset{\uparrow}{3}, 4, 0, -5, -$

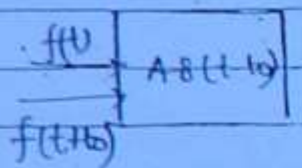
Ans

Eigen Function :



$\rightarrow A f(t)$

* If the response of a given LTI system is same as the i/p function f(t) except for a scaler multiple, the function is defined as eigen function of the system. So for a system with unit impulse response Aδ(t), any general signal f(t) forms an eigen function



$\rightarrow A f(t-t_0)$

$A f(t)$

$$f(t) \otimes A\delta(t-t_0)$$

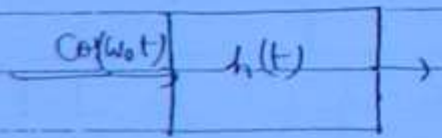
$$A f(t-t_0)$$

$$f(t-t_0) = f(t)$$

$$\downarrow$$

✓ f(t) should be periodic with period t0.

⊗ For a system with impulse response $A\delta(t-t_0)$, any signal which is periodic with a period t0 forms an eigen function.



$\rightarrow h(t) \otimes \cos\omega_0 t$

$$= \int_{-\infty}^{\infty} h(\tau)\cos[\omega_0(t-\tau)]\,d\tau$$

$$= \int_{-\infty}^{\infty} h(\tau)\left[\left(\cos\omega_0 t\cos\omega_0\tau\right)\right] + \quad d\tau$$

$$\int_{-\infty}^{\infty} h(\tau)\,\sin\omega_0 t\,\sin\omega_0\tau\,d\tau$$

$$y(t) = \cos\omega_0 t\int_{-\infty}^{\infty} h(\tau)\cos\omega_0\tau\,d\tau + \sin\omega_0 t\int_{-\infty}^{\infty} h(\tau)\sin\omega_0\tau\,d\tau$$

even signal

scaler (constant)

$$\int_{-\infty}^{\infty} h(\tau)\cos\omega_0\tau\, d\tau = A$$

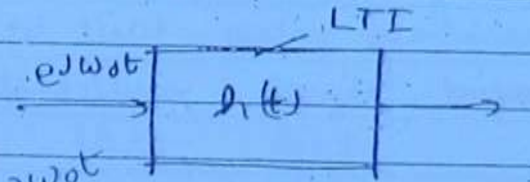
$$\int_{-\infty}^{\infty} h(\tau)\sin\omega_0\tau\, d\tau = 0$$

should be even signal

(57)

Condition for $\cos\omega_0 t$ to become eigen function of system.

⊗ For a system with general impulse response h(t), if $\cos\omega_0 t$ is to formed eigen function then impulse response h(t) must be an even function of time.



$$\to e^{j\omega_0 t} \otimes h(t)$$

$e^{j\omega_0 t}$ always forms an eigen function for a system for having impulse response h(t).

$$= \int_{\infty}^{\infty} h(\tau)\, e^{j\omega_0 (t-\tau)}\, d\tau =$$

$$= e^{j\omega_0 t} \int_{-\infty}^{\infty} h(\tau)\, e^{-j\omega_0\tau}\, d\tau$$

$$= e^{j\omega_0 t} \int_{-\infty}^{\infty} h(\tau)\left[\cos\omega_0\tau - j\sin\omega_0\tau\right]$$

$$= e^{j\omega_0 t}\left[\int_{\infty}^{\infty} h(\tau)\cos\omega_0\tau\, d\tau - j\int_{-\infty}^{\infty} h(\tau)\sin\omega_0\tau\, d\tau\right.$$

$h(\tau) \to$ should be even

$h(t) \to$ should be an even function of time to then $e^{j\omega_0 t}$ can form eigen function for system (LTI) having impulse response h(t) if h(t) is an even function of time or ~~h(t) should be even conjugate function~~

$$e^{j\omega_0 t} \longrightarrow H(j\omega_0)\, e^{j\omega_0 t}$$

$$C_1 e^{j\omega_0 t} \longrightarrow C_1 H(j\omega_0)\, e^{j\omega_0 t}$$

$$C_2 e^{j\omega_1 t} \longrightarrow C_2 H(j\omega_1)\, e^{j\omega_1 t}$$

$f(t) = \sum C_n e^{jn\omega_0 t} \Rightarrow r(t) \rightarrow \sum_{n=-\infty}^{\infty} C_n e^{jn\omega_0 t} H(jn\omega_0)$

(*) Signal $e^{j\omega_0 t}$ forms an eigen function for any general LTI system with impulse response, response of any LTI system when i/p is $e^{j\omega_0 t}$ can be written as $e^{j\omega_0 t} \cdot H(j\omega_0)$ where $H(j\omega_0)$ is defined as

$$H(j\omega_0) = \int_{-\infty}^{\infty} h(\tau) \cdot e^{-j\omega_0 \tau} d\tau$$

If we can now express any signal $f(t)$ as some of complex exponentials, response also will be some of no of complex exponential signal multiplied by a suitable value

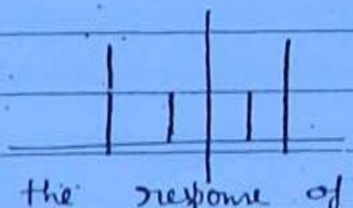
i.e. $f(t) = \sum_{n=-\infty}^{\infty} C_n e^{jn\omega_0 t}$ will have a response

$$r(t) = \sum_{n=-\infty}^{\infty} C_n e^{jn\omega_0 t} \cdot H(jn\omega_0)$$

$$\text{where } H(jn\omega_0) = \int_{-\infty}^{\infty} h(\tau) e^{-jn\omega_0 \tau} d\tau$$

Q. A discrete time system with an impulse response

$$h[n] = \begin{cases} 2 & n = 2, -2 \\ 1 & n = 1, -1 \\ 0 & \text{otherwis} \end{cases}$$



given an i/p $f[n] = e^{jn\pi/2}$ find the response of the system.

$$r[n] = \sum_{K=-\infty}^{\infty} h[K] f[n-K] = \sum_{K=-\infty}^{\infty} h[K] e^{j(n-K)\pi/2}$$

$$= e^{jn\pi/2} \sum_{K=-\infty}^{\infty} h[K] e^{-jK\pi/2}$$

$$= e^{jn\pi/2} \left[2 \cdot e^{j\pi} + 1 e^{j\pi/2} + 1 e^{-j\pi/2} + 2 e^{-j\pi} \right]$$

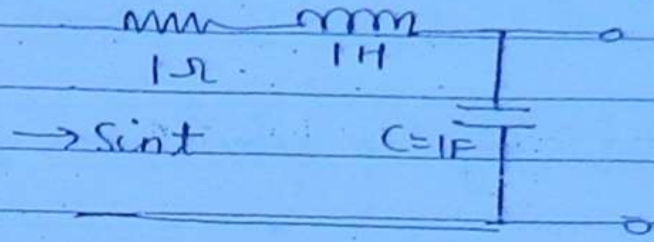
$$= e^{jn\pi/2} \left[-4 \right]$$

$$r[n] = -4 \, e^{jn\pi/2}$$

(−4) eigen value and $e^{jn\pi/2}$ eigen function

$\frac{2\pi}{\pi/2} = 4$

Q. Find the response of following ckt to an i/P Sint



59

$\cancel{i(t)} = \frac{\cancel{\sin t}}{\cancel{1=}}$ $\sin t = \frac{e^{jt} - e^{-jt}}{2j}$

$= \frac{\sin t}{1 + j + \frac{1}{j \times 1}}$

$i(t) = \sin t$

$\therefore V(t) = \frac{1}{j} \sin t = \sin(-t - \pi/2) = -\cos t$

$= -j \sin t$ $-\sin(t + 3\pi/2)$

$$\boxed{V(t) = \sin t \angle 3\pi/2}$$

o/P   i/P

$L \cdot C \cdot \frac{d^2 V_1(t)}{dt^2} + RC \frac{dV_1(t)}{dt} + V_1(t) = V_i(t)$

$1 \cdot \frac{d^2}{dt^2} \sin t + 1 \cdot \frac{d}{dt} \sin t + \sin t = V_i(t)$

LTI system → $-\sin t + \cos t + \sin t = V_o(t)$

$V_o(t) = \cos t$

$V_o(t) = \cancel{\cos} - \sin(\pi/2 + t)$

$= \sin(t - \pi/2)$

$H(j\omega_0) = -j$

$H(j \cdot 1) = -j$

$H(j\omega_0) = \frac{1}{(j\omega_0)^2 + j\omega_0 + 1}$

inner product

$\bar{x}\cdot\bar{y} = 0$

$[\bar{x},\bar{y}] \rightarrow$ orthogonal

independent

then we can express any a vector inform of $\bar{x}$ & $\bar{y}$ vectors

similary $f(t)$, $g(t)$

$$\int_0^T f(t)\, g(t)\, dt = 0$$

in interval→$(0, T)$, $f(t)$, $g(t)$ are orthogonal

$$\int_0^{2\pi/\omega_0} \sin m\omega_0 t \cdot \sin n\omega_0 t \, dt$$

m, n integer (+ve) ≥ 0 or −ve integer ≤ 0
and $m \neq n$

then above integral will be zero always.

then $\sin m\omega_0 t$ is orthogatal $\sin n\omega_0 t$ ~~is orth~~ in interval $(0, 2\pi/\omega_0)$

$$\int_0^{2\pi/\omega_0} \cos m\omega_0 t \ \cos n\omega_0 t \, dt$$

if $m \neq n$ and $m \geq 0$ or $m \leq 0$
condition on m & n
and $n \geq 0$ or $n \leq 0$
m and n are integers
then $\cos m\omega_0 t$ & $\cos n\omega_0 t$ both will be orthogonal in interval $(0, 2\pi/\omega_0)$

~~Same will be true for~~

$$\int_0^{2\pi/\omega_0} \sin K\omega_0 t \ \cos K\omega_0 t \, dt = 0$$

if K is any integer other than 0

so we can define any f(t) in terms of independent function $\cos k\omega_0 t$ & $\sin k\omega$

$$f(t) = a_0 + a_1 \cos\omega_0 t + a_2 \cos 2\omega_0 t + \cdots$$
$$+ b_1 \sin\omega_0 t + b_2 \sin 2\omega_0 t + \cdots$$

(6.1)

$$f(t) = a_0 + \sum_{n=1}^{\infty} (a_n \cos n\omega_0 t + b_n \sin n\omega_0 t)$$

f(t) is periodic with period $= \frac{2\pi}{\omega_0}$

22nd oct 10

$$f(t) = a_0 + \sum_{n=1}^{\infty} \sqrt{a_n^2 + b_n^2}\, \cos(\overset{n}{\omega_0} t - \phi_n)$$

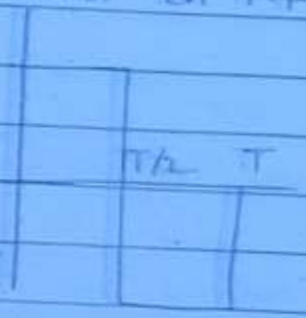
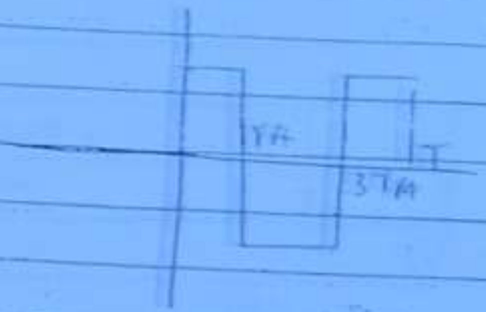
Q. ~~After~~ of following signal which of signals will have only odd sine terms in T.F.S. → defined in one time period.

(i)

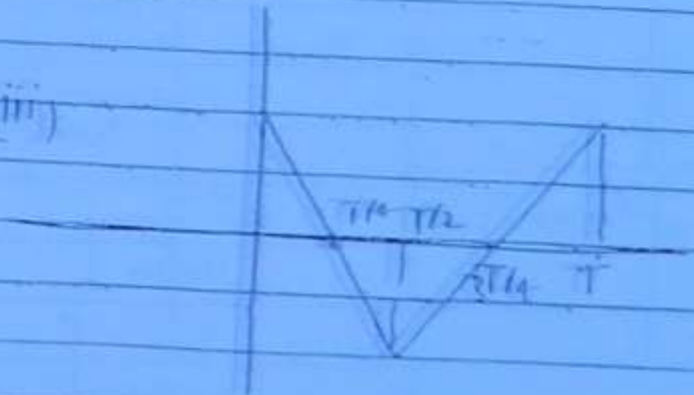


Ans (i) & (IV)

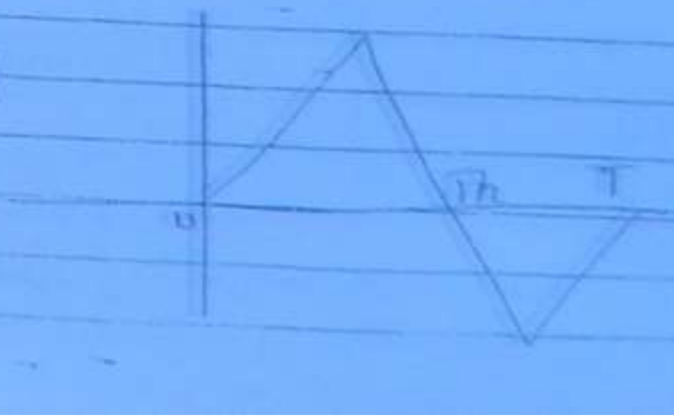
(ii)



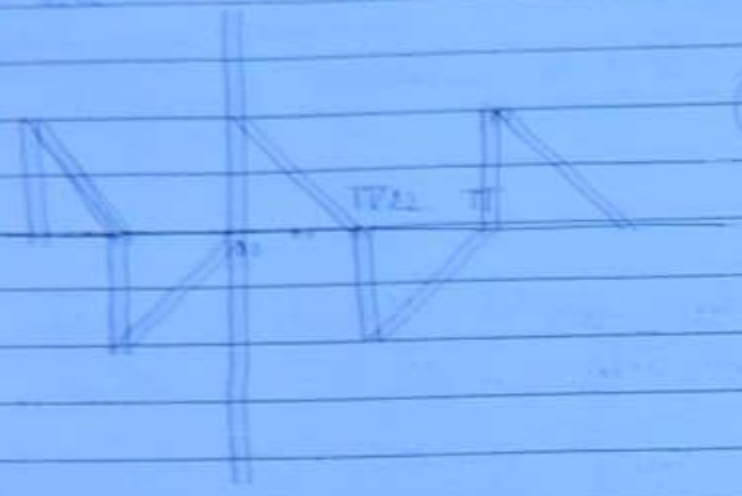
(iii)



(iv)



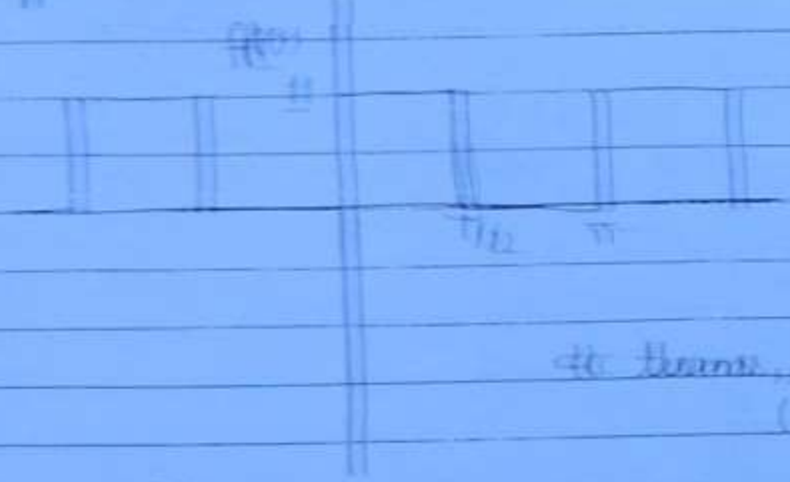
Q. A signal f(t) is defined as shown below →



Q2

→ only odd sine & cosine terms

Q. A signal f(t) is defined as below



Neither even nor odd and not half wave symmetry

dc terms, $\overset{odd}{\text{sine terms}}$, ~~[illegible]~~ (odd cosine terms) Any

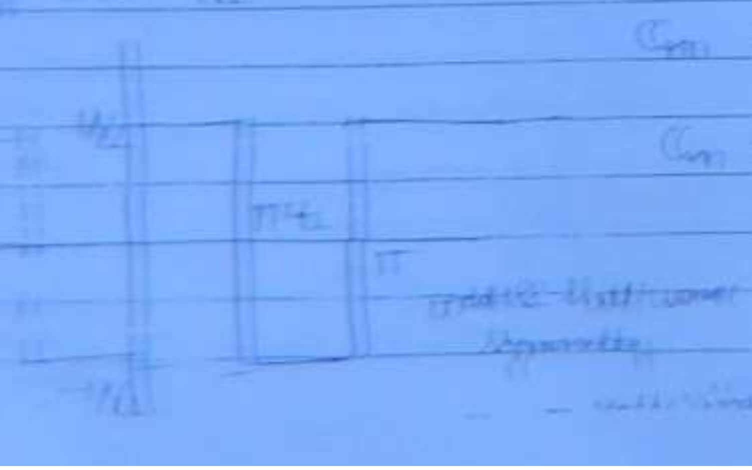
$$C_n = \frac{1}{T}\int_0^{T/2} 1 \cdot e^{-jn\omega_0 t}\,dt = \frac{1}{Tjn\omega_0}\left[1 - e^{-jn\omega_0 T/2}\right]$$

$$= \frac{1}{Tjn2\pi}\left[1 - e^{-jn\pi}\right]$$

modified f(t) − 1/2

$$C_n = \frac{1}{Tjn2\pi}\left[1 - \cos n\pi\right]$$

$$C_n = \frac{1}{j2\pi n}\left(1 - \cos n\pi\right)$$



odd & half wave symmetry

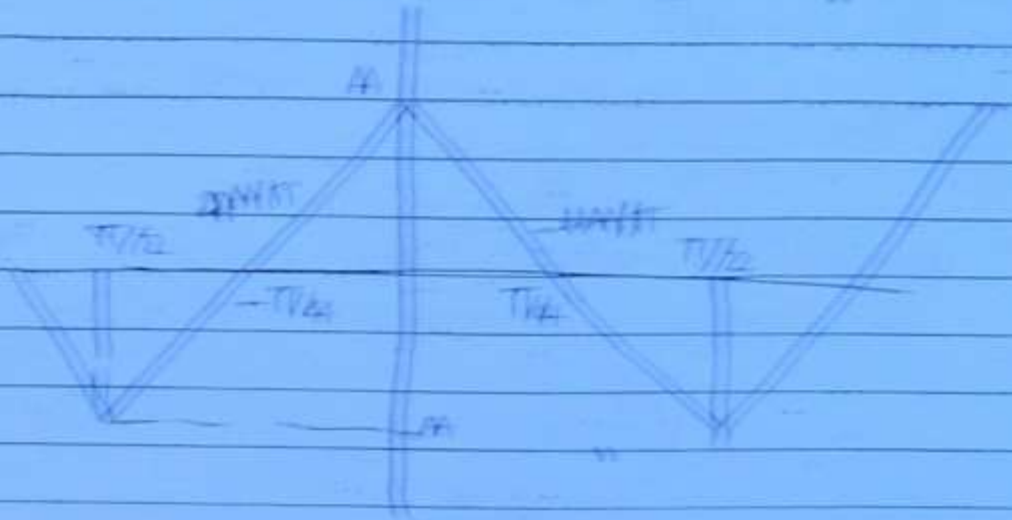
Here f(t)

dc term = 1/2

— odd sine terms (dc term − 1/2 = 0)

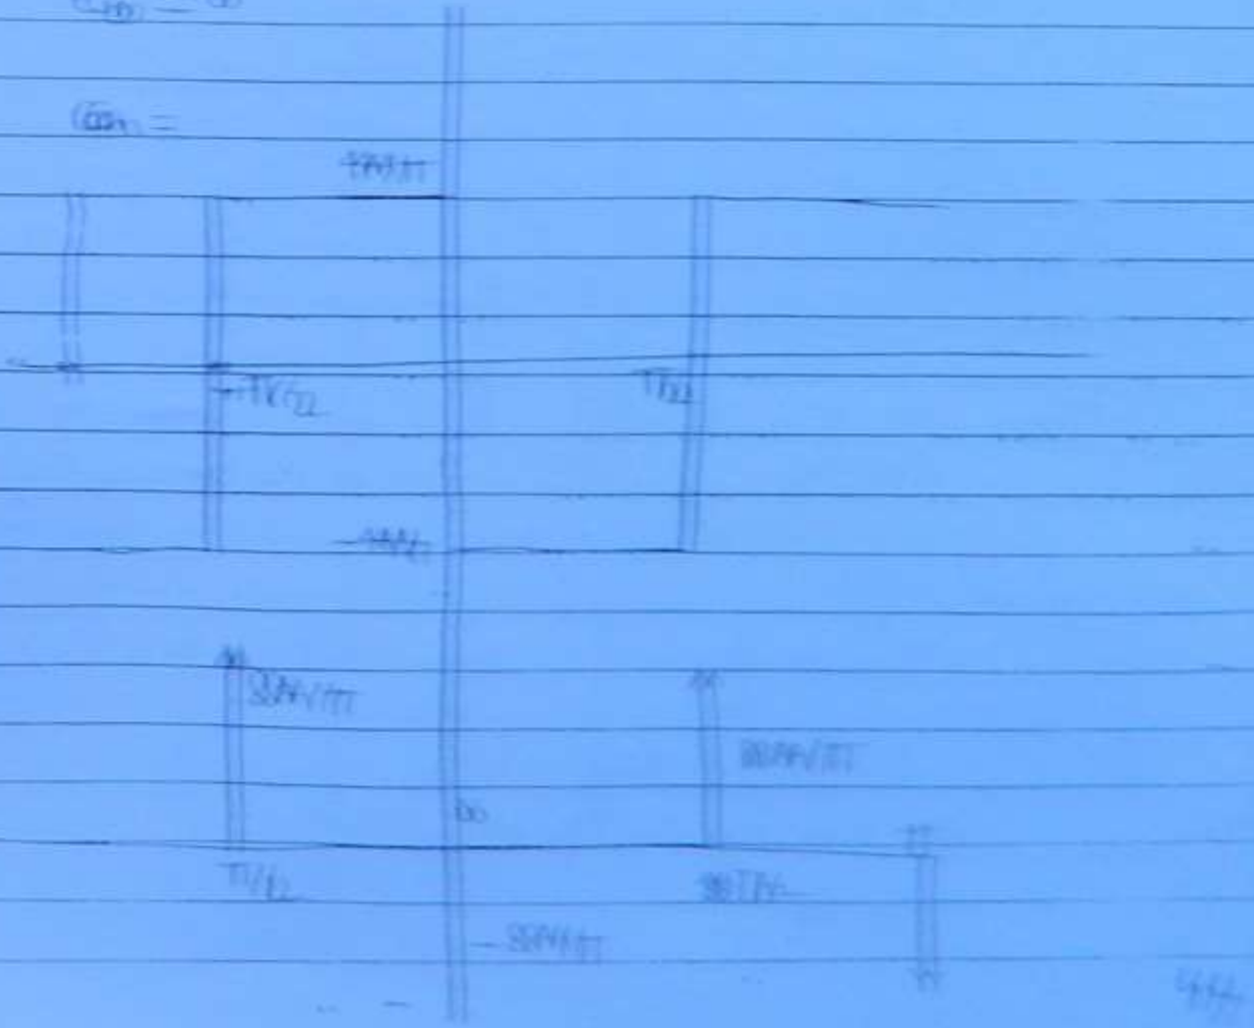
(iii) If we add some constant to $x(t)$ then only dc term will change and other fourier coefficient will remain same.

Q Calculate the fourier coefficient of following signals.



$C_0 = 0$

$C_n =$



for this impulse

$$C_n = -\frac{8A}{T}\cdot\frac{1}{T}e^{-jn\omega_0 T/2} - \frac{8A}{T}\cdot\frac{1}{T}$$

$$= \frac{8A}{T^2}\left[e^{-jn\omega_0 T/2} - 1\right]$$

$$= \frac{8A}{T^2}\left[e^{-jn\pi} - 1\right].$$

$$C_n = \frac{8A}{T^2}\left[\cos n\pi - 1\right]$$

fourier cofficient of f(t).

$$6 \quad F_n = \frac{C_n}{(j\omega_0 n)^2}$$

$$= -\frac{8A}{T^2\omega_0^2 n^2}\left[\cos n\pi - 1\right]$$

$$= \frac{8A}{T^2\omega_0^2 n^2}\left[1 - \cos n\pi\right]$$

$$\boxed{F_n = \frac{2A}{\pi^2 n^2}\left[1 - \cos n\pi\right)} \text{ Ans}$$

↓ real & even because signal is real & even.

$$F_0 = 0$$

$$F_n = \frac{2A}{\pi^2 n^2}\left[1 - \underset{\substack{\| \\ 0 \text{ for } n \text{ even}}}{(-1)^n}\right] \longrightarrow$$ and only even terms because of half wave symmetry

$$F_n \propto \frac{1}{n^2} \rightarrow F_n \propto |n|^{-2}$$

Triangular pulse

for rectangular pulse

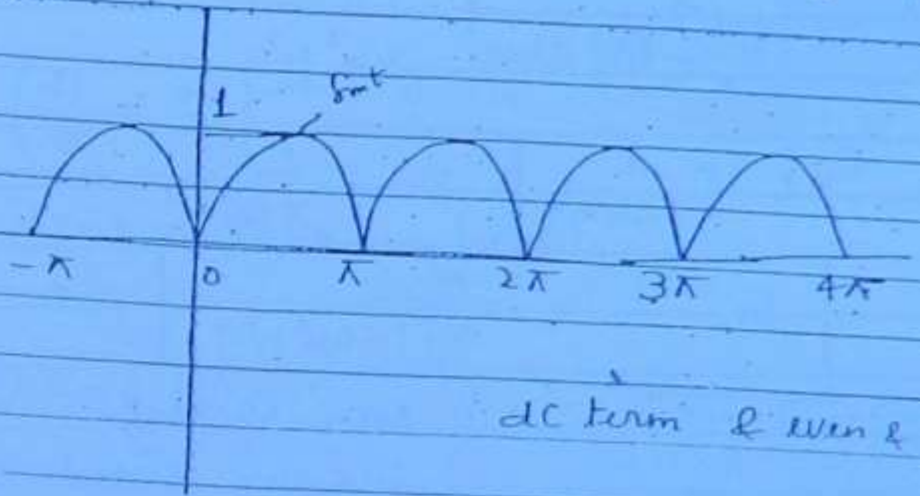
$$C_n \propto \frac{1}{n}$$

if function is varrying as parabolic variation in a p
means as a function t^2.

then fourier series coefficient will be

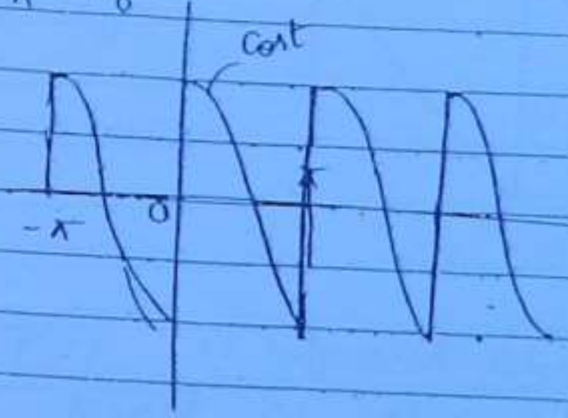
$$C_n \propto \frac{1}{n^3} \rightarrow C_n \propto |n|^{-3}$$

Q. Find the fourier coefficient of following signal

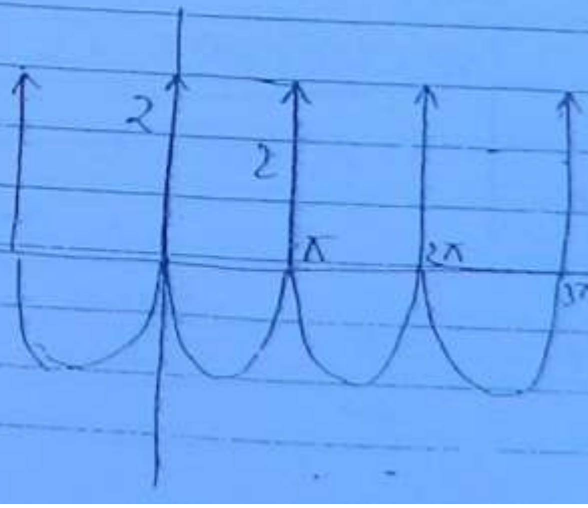


dC term & even & real

$$C_n = \frac{1}{\pi}\int_0^{\pi} \sin t \, e^{-jn\omega_0 t}\, dt$$ we can find



C_n



~~Fn = Cn for infinite~~

— Fn

~~2Fn = 2~~

IΠ

clear
distu

$$C_n = (\underset{\text{Fou}}{\text{impulse}} - F_n)$$

$$C_n = \left(\frac{2}{\pi} - F_n\right)$$

$$F_n = \frac{C_n}{(j\omega_0 n)^2}$$

$$= -\frac{2}{\pi\omega_0^2 n^2} + \frac{F_n}{\omega_0^2 n^2}$$

$$F_n\left[1 - \frac{1}{\omega_0^2 n^2}\right] = -\frac{2}{\pi\omega_0^2 n^2}$$

$$\boxed{F_n = \frac{2}{\pi(1-\omega_0^2 n^2)}} = \frac{2}{\pi(1-4n^2)}$$

even & real

because ~~signal~~ i f(t) is real & even.

if $|b| > 1$ then z-transform can't be defined.

* Combination of left sided signal will have always a defined Z-transform with an ROC which is inward directed bounded by the circle whose radius is the magnitude of the least pole. 1/10

Q. $f[n] = (3/4)^n u[n] + (5/6)^n u[n] + \left(\frac{7}{8}\right)^n u[-n-1] + \left(\frac{9}{10}\right)^n u[-n-1]$

$$F(z) = \frac{z}{z-3/4} + \frac{z}{z-5/6} - \frac{z}{z-7/8} - \frac{z}{z-9/10}$$

$$\left(5/6 < |z| < 7/8\right)$$

$4^{1/3}$ $5^{1/2}$

$\boxed{6^{1/3} \quad 5^{1/2}}$

$(6^2)^{1/6}$ $(5^3)^{1/6}$

$(36)^{1/6}$ $(125)^{1/6}$

* Combination of right sided and left sided signal will have an ROC which is a finite circular strip bounded on the lower side by a circle whose radius is the magnitude of the greatest pole of all the right sided signals and on upper side by a circle whose radius is the magnitude of the least pole of all the left sided signal.

find the Z-transform of signal

$f[n] = 2^n u[n] + 5^n u[n] - 2^n u[n-1] - 5^n u[-n-$

$$\left\{ \frac{z}{z-2} + \frac{z}{z-5} + \frac{z}{z-2} + \frac{z}{z-5} \right\}$$

$|z| > 5$ { simultaneously not possible } { not defined

$|z| < 2$

of the impulse response of such a stable & causal system must lie inside the unit circle.

* For a discrete time signal f[n], fourier transform can be defined as $F(\omega) = \sum_{n=-\infty}^{\infty} f[n] e^{-j\omega n}$, this is defined as discrete time Fourier transform or DTFT in short.

(*) DTFT of a discrete time signal F[n] is same as z-transform, with r = 1.

(*) So in the z-transform expression if we substitute i.e. $z = re^{j\omega}$ then r = 1 it will result in discrete time Fourier transform. i.e. If we substitute $z = e^{j\omega}$ in z-transform expression we get the DTFT provided ~~to~~ z-transform is defined for r = 1 i.e. ROC of the z-transform is including the unit circle.

(*) DTFT is z-transform evaluated along the unit circle.

$$\left(3/2\right)^n u[n] \longrightarrow \frac{z}{z-3/2} \quad |z| > 3/2$$

$$\left(\frac{3}{2}\right)^n u[n] + \left(\frac{5}{2}\right)^n u[n] \longrightarrow \frac{z}{z-3/2} + \frac{z}{z-5/2} \quad \begin{matrix}\text{ROC} \\ |z| > 5/\end{matrix}$$

* Combination of right sided ~~sign~~ discrete time signal will always have a defined z-transform with an ROC which is outward directed bounded by a circle whose radius is the magnitude of the highest pole.

$$-2^n u[-n-1] \longrightarrow \frac{z}{z-2} \cdot \quad |z| < 2$$

$$-5^n u[-n-1] - 2^n u[-n-1] \longrightarrow \frac{z}{z-5} + \frac{z}{z-2}$$

Splane will be map to all the circles having radius greater than 1, and jw axis of splane will be map to a circle of unit radius.

$$\boxed{\begin{array}{c} F[w] = \sum_{n=-\infty}^{\infty} f[n] e^{-jwn} \\ \text{DT.FT} \\ \text{Discrete time fourier transform} \end{array}}$$

* ROC of Z-transform is a set of concentric circles, generally a circular strip.

* ROC of the Z-transform can't include any poles but is bounded by the circle whose radius is the magnitude of pole.

* ROC of right sided signal is outward directed i.e outside some circle.

* ROC of left sided signal is inward directed i.e. inside some circle

* If a system with impulse response h[n] is to be stable condition $\sum_{n=-\infty}^{\infty} |h[n]| < \infty$ and for this to be satisfied the region of convergence of the z-transform of the impulse response must be including unit circle.

* A system with impulse response h[n] is causal if $h[n]=0$ for $n<0$. and in this case the region of convergence of z-transform of impulse response must be outward directed

* If a system with impulse response h[n] is to both stable & causal ROC must be including the unit circle and must be outward directed and ROC can't include any poles.

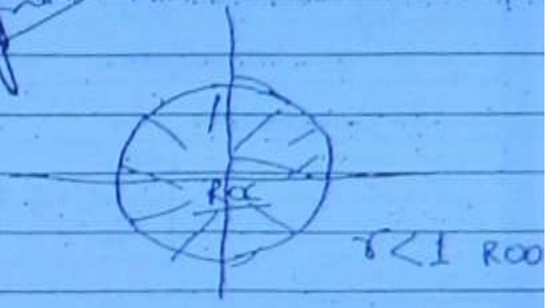
So for a system with impulse response h(n) to be stable and causal all the poles of the Z-transform

Find z-transform of $f[n] = u[-n-1]$

$$F[z] = z + z^2 + \cdots$$ ①③

$$F[z] = z \frac{1}{(1-z)} \qquad |z|<1$$

$$F[z] = \frac{-1}{(1-z^{-1})} \qquad |z|<1 \text{ ROC}, \ r<1$$



$$a^n u(n) = \frac{1}{(1-az^{-1})} \qquad |az^{-1}|<1 \qquad \left|\frac{z}{a}\right|>1$$

$$|z|>|a| \qquad |z|>|a|$$

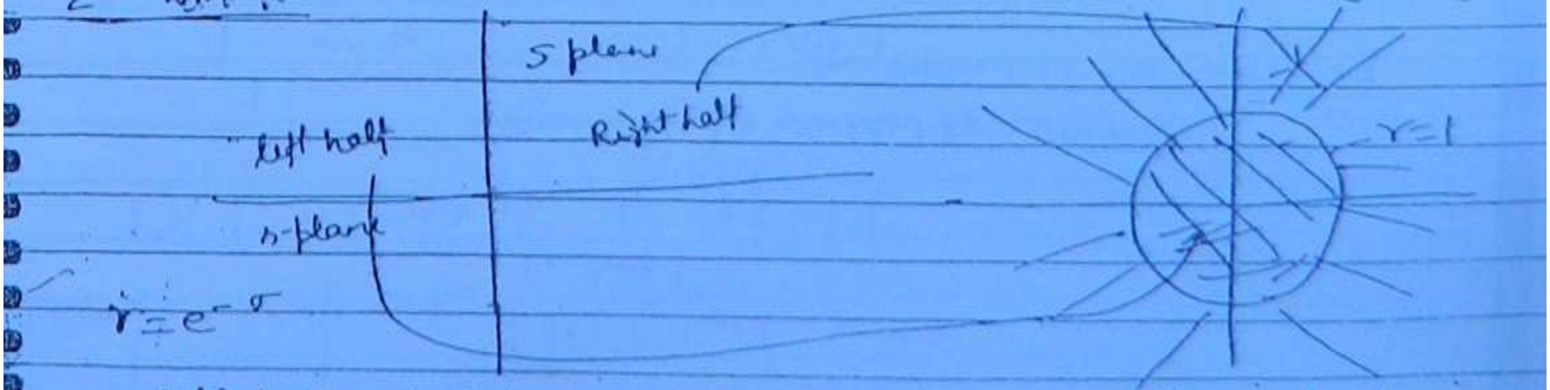
$$-a^n u[-n-1] = \frac{1}{(1-az^{-1})} \qquad |z|<|a| \qquad \left|\frac{z}{a}\right|<1$$

$$|z|<|a|$$

$$f[n] \longrightarrow F(z)$$

$$a^n f[n] \rightarrow F[z/a] \quad \text{ROC} \rightarrow \overset{\text{according to}}{\left|\frac{z}{a}\right|}$$

2nd Nov! lo



left half of Splane will be map to all circle having Radius [illegible]

For a discrete time signal $f[n]$, z-transform is defined as $F[z] = \sum_{n=-\infty}^{\infty} f[n] z^{-n}$

where z- is complex variable defined as $z = re^{j\omega}$. this can be understood as laplace transform a discrete time signal $f[n]$, the complex variable $s = \sigma + j\omega$ in rectangular form is replaced by a complex variable $z = re^{j\omega}$ in polar form. If the z-transform of the signal $f[n]$ is to be defined, the condition is

$$\left| \sum_{-\infty}^{\infty} f[n] z^{-n} \right| < \infty$$

$$\sum_{n=-\infty}^{\infty} |f[n] \cdot z^{-n}| < \infty$$

$$\sum_{n=-\infty}^{\infty} |f[n] r^{-n}| < \infty$$

Best on the nature of given discrete time signal $f[n]$ there will be a set of r values for which above conditio is satisfied, this region of r values for which the z-transform of a signal $f[n]$ is defined is called as region of convergen of z-transform and it is specified in terms r or $|z|$ (ROC)

find z-transform of

$$f[n] = \delta[n]$$

$$F(z) = 1$$

$$z^{-} \quad 1 + z^{-1} + \ldots$$

$$\frac{1}{1}$$

$$f[n] = u[n]$$

$$= \quad F[z] = \frac{1}{(1 - z^{-1})} \quad \text{ROC } |z^{-1}| < 1$$

$$\text{ROC} \rightarrow \Big| |z| > 1 \Big|$$

Calculate the final value of $F(s) = \frac{S+2}{(S^2+3S+2)}$

$$\lim_{S\to 0} SF(S) = \lim_{S\to 0} \frac{S(S+2)}{(S+2)(S+1)}$$

$$= 0$$

Z-transform:

↳

$$F(z) = \sum_{n=-\infty}^{\infty} f[n]\, z^{-n} \qquad \boxed{z = e^{j\omega}}$$

$$F(z) = \sum_{n=-\infty}^{\infty} f[n]\, e^{-\sigma n}\, e^{-j\omega n}$$

$$S = (\sigma + j\omega)$$
$$z = r e^{j\omega}$$

$r = e^{\sigma}$

$$= \sum_{n=-\infty}^{\infty} f[n]\, r^{-n} (e^{j\omega})^{-n}$$

$$= \sum_{n=-\infty}^{\infty} f[n]\, r^{-n}\, z^{-n}$$

$$= \sum_{n=-\infty}^{\infty} f[n]\, [re^{j\omega}]^{-n}$$

$$re^{j\omega} = z$$

$$F[z] = \sum_{n=-\infty}^{\infty} f[n]\, z^{-n}$$

for z- transform to be defined summation must be converging

$$\left| \sum_{n=-\infty}^{\infty} f[n]\, z^{-n} \right| < \infty$$

$$\sum_{n=-\infty}^{\infty} \left| f[n]\, z^{-n} \right| < \infty$$

$$\sum_{n=-\infty}^{\infty} \left| f(n)\, r^{-n} \right| < \infty$$ for a set of r values

when ever result comes ∞ → not defined.
$\infty - \infty$ because ∞ is a undefined quantity

Initial value theorem →

(116) $\lim \lim_{t \to 0} f(t) = \lim_{S \to \infty} SF(S)$

Initial value theorem $\boxed{f(0^-) = \lim_{S \to \infty} SF(S)}$

Final value theorem $\boxed{\lim_{t \to \infty} f(t) = \lim_{S \to 0} SF(S)}$

$F(S) = \frac{\omega_0}{S^2 + \omega_0^2}$ = Sinusoidal

$\boxed{-1 \leq f(t) \leq 1}$

(*) Initial value theorem can be applied only if degree of numerator of L.T. is less than the degree of denominator

$$F(S) = \frac{S+2}{S^2+3S+2} = \frac{A}{(S+1)} + \frac{B}{S+2}$$

I.L.T ↑ exists

$$F(S) = \frac{S^2+2S+3}{S^2+3S+2} = 1 + \frac{1-S}{S^2+3S+2}$$

$\delta(t)$

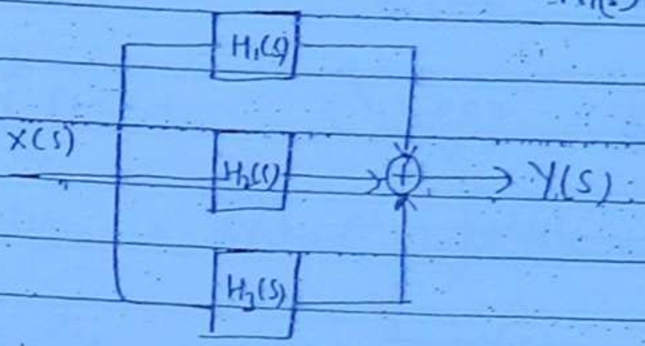
(*) If the degree of numerator is greater than or equal to degree of denominator, we will have derivatives of impulses or impulses themselves in I.L.T. whose value is not known at $t = 0$ hence initial value theorem can't be applicable.

(*) Final value theorem of L.T. can be applied only if all the poles of S.F(S) lie in left half of the S-plane (Strictly left half i.e. excluding jω axis

Parallel Representation.

$$H(S) = \frac{A}{(S+a_0)} + \frac{B}{(S+B)} + \frac{C}{S^2+B^2} + - -$$

$$H_1(S) + H_2(S) + H_3(S)$$



(*) $F(S) = \int_{-\infty}^{\infty} f(t)\, e^{-st}\, dt$

two sided L.T.

Bilateral L.T.

$F(S) = \int_{0}^{\infty} f(t)\, e^{-st}\, dt$ one sided L.T.

also called as unilateral L.T.

when analysis is started from $t = 0$ ($f(t)$ may exist before $t = 0$)

In unilateral transform ROC does not play important role while it plays an important role in bilateral transform.

(*) Unilateral transform for a signal $f(t)$ is defined as

$F(S) = \int_{0}^{\infty} f(t)\, e^{-st}\, dt$ → also called as one sided L.T. and unilateral transform for any signal $f(t)$, is unique and hence region of convergence need not be specified to denote the uniqueness of L.T.

$f(t) \leftrightarrow F(S)$ [$F(S)$ is unilateral transform of $f(t)$]

$f(t-t_0) \cdot u(t-t_0) \longleftrightarrow F(S)\, e^{-St_0}$

$$\frac{df(t)}{dt} \longrightarrow \underbrace{SF(S) - f(0^-)}$$

analysis start at at $t = 0$

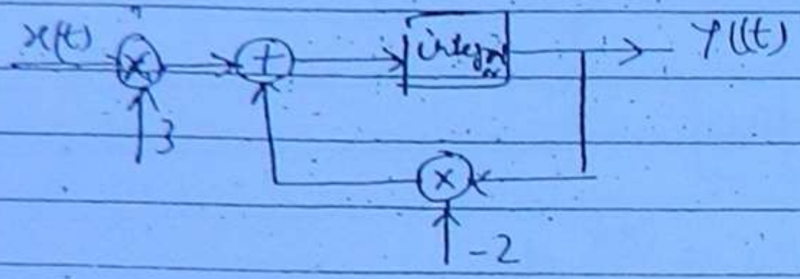
[illegible] exist before

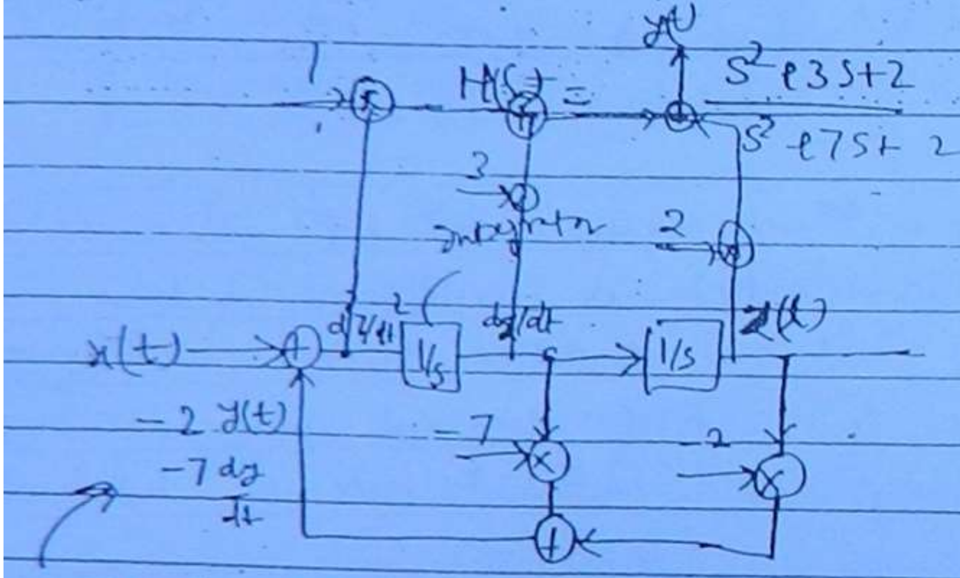
$$\frac{dy}{dt} + 2y(t) = 3x(t)$$

$$\frac{dy}{dt} = -2y(t) + 3x(t).$$

$$H(S) = 3/\underline{S+2}$$

$$\boxed{h(t) = 3e^{-2t}\,\underline{u}(t)}$$





$$= \frac{1}{S^2+7S+2} \cdot (S^2+3S+2)$$

$H(S)$ $\quad$ $H_2(S)$

$d^2z/dt^2 + \dots = y(t$

cascade Representation of LTI systems:-

$f(t) \longleftrightarrow F(S)$

$\frac{d\,f(t)}{dt} \longrightarrow SF(S) - f(0-)$

$\frac{d^2 f(t)}{dt^2} \longrightarrow S^2 F(S)$ ~~$- s f(0-) - f'(0-)$~~

$\int_{-\infty}^{t} f(\tau)\,d\tau \longrightarrow \frac{F(S)}{S}$ ~~[illegible] $f(t) = 0 \quad t<0$~~

Q. A system is defined by the following differential eqn

$$\frac{d^2y}{dt^2} - 2\frac{dy}{dt} + 10\,y(t) = 2\frac{dx}{dt} + 3x(t)$$

Is this linear T.I. system. Yes this is LTI system.

$$H(S) = \frac{2S+3}{(S^2-2S+10)}$$

find h(t) for it to be stable

$$= \frac{2S+3}{(S-1)^2+9}$$

$$H(S) = \frac{2[S-1]+5}{(S-1)^2+9}$$

$$H(S) = \frac{2(S-1)}{(S-1)^2+9} + \frac{5}{(S-1)^2+9} \qquad \sigma < 1$$

$$h(t) = -2e^{t}\cos 3t\, u(-t) - \frac{5}{3}e^{t}\sin 3t\, u(-t)$$

Ans

$t<1 \quad \sigma$

Find impulse response of above system is to be causal

$$= 2e^{t}\cos 3t\, u(t) + 5/3\, e^{t}\sin 3t\, u(t)$$ Ans

$\sigma > 1$

Q. $h(t) = e^{-t} u(t)$, $f(t) = e^{-3t} u(t) + e^{-2t} u(-t)$

does not exist because no common values of σ for which all laplace transform exist.

laplace transform of a dc signal $f(t) = 1$

$$= \int_{-\infty}^{\infty} |e^{-\sigma t}|\, dt < \infty \rightarrow \text{not possible}$$

this condition will not be ~~a~~ satisfied for any σ therefore laplace transform does not exist

$Sgn(t) \longleftrightarrow$ not defined

$f(t) = e^{-b|t|} = e^{-bt}u(t) + e^{bt}u(t)$

$$L.T. = \frac{1}{S+b} - \frac{1}{(S-b)} = \frac{-2b}{(S^2+b^2)}$$

$\sigma > -b \qquad \sigma < b \qquad = \frac{2b}{(b^2-S^2)}$

ROC → $-b < \sigma < b$

$b > 0$ then it is possible.

$e^{at}[u(t) - u(t-1)] = \frac{e}{(S-a)} - \frac{e^{-s}}{(S-a)} \longrightarrow$

any pole, so all the poles of laplace transform of impulse response of such a causal & stable system must be lying on the left of s-plane.

$e^{2t} u(t) = \frac{1}{(S-2)}$ ⓇⒺ —

$e^{2t} u(t) + e^{5t} u(t) \longrightarrow \frac{1}{(S-2)} + \frac{1}{(S-5)}$ ROC $\sigma > 5$

⊛ Combination of any no. of right sided signal will always have defined laplace transform, which is some of all the individual Laplace transform with an ROC which is right sided bounded by greatest among all the poles.

$-e^{2t} u(-t) = \frac{1}{(S-2)}$ $\boxed{Re(S) < 2}$ ROC.

$\sigma < 2$ ROC

⊛ Any combination of left sided signals will have a defined laplace transform, which is some of all individual laplace transforms with an ROC which left sided ~~by~~ bounded by least among all the poles.

⊛ $f(t) = e^{-2t} u(t) + e^{-5t} u(t) + e^{2t} u(-t) + e^{5t} u(-t)$

$\frac{1}{S+2} + \frac{1}{S+5} - \frac{1}{(S-2)} - \frac{1}{(S-5)}$ Ans

$Re(S) > -2$ $Re(S) > -5$ $Re(S) < 2$ $Re(S) < 5$

$S > -2, \quad S < 2$

$-2 < Re(S) < 2$

$-2 < \sigma < 2$

if it is causal $h(t) = 0$ $t < 0$
right sided signal

and laplace transform for right sided signal ~~is~~ ~~righ~~ has ROC which should be ~~is~~ right sided.

(*) If system is both stable & causal then ROC must be right sided & include $\sigma = 0$ line and it can't include any poles so for system to be causal & stable all the poles must lie on left half of S plane ($\because$ ROC will be right side to poles having highest σ.

(*) ROC of left sided is signal is also left sided

(*) if F.T. of a signal is to be defined laplace transform of corresponding must be having an ROC including $\sigma = 0$ line or $j\omega$ axis and corresponding F.T. can be obtained by replacing s in laplace transform expression by $j\omega$.

(*) A system with impulse response $h(t)$ is called as stable system if $\int_{-\infty}^{\infty} |h(t)|\, dt < \infty$ which is the same condition for the F.T. of $h(t)$ to be defined. So if a system ~~so~~ with impulse response $h(t)$ is to be a stable system it must be having a laplace transform with it's ROC including $\sigma = 0$ line

(*) ~~9~~ If a system with impulse response $h(t)$ is to be causal $h(t) = 0$ $t < 0$ i.e $h(t)$ must be generally right sided. So if a system with impulse response $h(t)$ is to be causal it's laplace transform must be having an ROC which is right sided extending till $\sigma = \infty$

(*) If a system with impulse response is to be both causal and stable ROC must be right sided including $\sigma = 0$ li [illegible]

Calculate Laplate t. $\underline{-u(-t)} = 1/s$ ROC $\sigma < 0$

[illegible]

$f(t) \longrightarrow F(S)$ $Re\{S\}$

$e^{at} f(t) \longrightarrow F(S+a)$ $Re\{S-a\}$

$e^{-at} u(t) \longleftrightarrow \frac{1}{(S+a)}$ $Re\{S+a\} > 0$

$Re\{\sigma+a\} > 0$

$\sigma > (-a)$

$e^{at} u(t) \longrightarrow \frac{1}{(S-a)}$ $\sigma > a$

$Re\{(S-a)\} > 0$

$-u(-t) \longrightarrow \frac{1}{S}$ $Re\{S\} < 0$

$-e^{-at} u(-t) \longrightarrow \frac{1}{(S+a)}$ $Re\{S+a\} < 0$ ROC

$\sigma < -a$ ROC

$-e^{at} u(t) \longleftrightarrow \frac{1}{(S-a)}$ $Re\{S-a\} < 0$

$\sigma < a$

(*) For a system having impulse response h(t), and having laplace transform H(S), for system to be stable, ROC of H(S) must include $\sigma = 0$ line

∴ for stability

$$\int_{-\infty}^{\infty} |h(t)| < \infty$$

this is also condition for, F.T. to exist and from laplace transform we can get F.T. only if it's ROC includes $\sigma = 0$ line.

So if it includes $\sigma = 0$ in its ROC, then F.T. exists and system will be stable

F.T. means which can be directly find by integration w.r.t

transform is defined. This region of σ value is called as region of convergence [ROC].
We specify ROC for the laplace transform in terms of σ or real part of s.

③

Find Laplace T. $f(t) = \delta(t)$

$$L[f(t)] =$$

$$\int_{-\infty}^{\infty} |f(t)\, e^{-\sigma t}|\, dt < \infty$$

$$\int_{-\infty}^{\infty} |\delta(t)\, e^{-\sigma t}|\, dt < \infty$$

~~for all~~ $\int_{-\infty}^{\infty} \delta(t)\, dt = 1 < \infty$

for all values of σ Laplace transform will be defined.

$\therefore$ $L[\delta(t)] = 1$ ROC → all value of σ.

Laplace transform of $u(t)$.

$$\int_{-\infty}^{\infty} |f(t)\, e^{-\sigma t}| < \infty$$

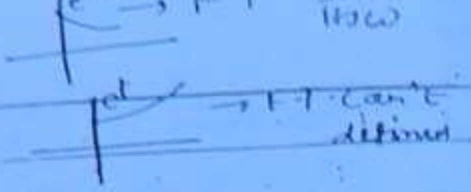
$$\int_{-\infty}^{\infty} |u(t)\, e^{-\sigma t}| < \infty$$

for $\sigma > 0$

$$\int_{0}^{\infty} |e^{-\sigma t}| < \infty$$

for $\sigma > 0$ → this integral converges

$\therefore$ $L[u(t)] = \int^{\infty} e^{-st}\, dt = 1$ ROC



but F(S) must be converging.

$$|F(S)| < \infty$$

$$\left| \int_{-\infty}^{\infty} f(t)\, e^{-St}\, dt \right| < \infty \quad \rightarrow (\because (S = \sigma + j\omega))$$

$$\int_{-\infty}^{\infty} |f(t) e^{-\sigma t}|\, dt < \infty$$

↓
condition ~~to~~ to find ROC.

σ is real part of S
Re{S} → so ROC is defined in terms of Re{S}.

(*) For a signal f(t) Laplace transform is defined as $= \int_{-\infty}^{\infty} f(t) e^{-St}\, dt$

where S is a complex variable and is equal $= (\sigma + j\omega)$
So if we substitute $\sigma = 0$ in laplace transform ~~is~~ is equivalent to F.T. or laplace transform is more general form of F.T.

(*) We can also understand laplace transform as $F[f(t) e^{-\sigma t}]$ where σ is called damping ~~frequency~~ factor.

(*) For a laplace transform to be defined, laplace transform integral must be converging

i.e.

$$\int_{-\infty}^{\infty} |f(t) e^{-St}|\, dt < \infty$$

$$\int_{-\infty}^{\infty} |f(t) e^{-\sigma t}|\, dt < \infty \qquad (\because |e^{-j\omega t}| = 1$$

So based on the nature of the given signal f(t) there will be a region of σ-values for [illegible] and laplace

Q. Repeat the previous problem for i/p PSD

$f_c = \frac{a}{2\pi}$ Hz.

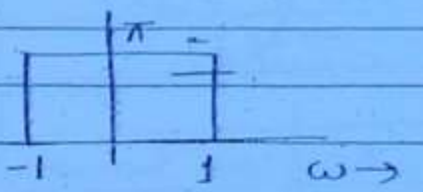
* The above ω_c value calculated can also be called as 50% energy B.W. of the signal likewise we can calculate % energy B.W. for the above signal for the specified energy required.

Q. In the following setup calculate the B.W. of signal $y_1(t)$, $y_2(t)$ & $y_3(t)$

→ means significant frequencies present in signal

B.W. of a signal: The width of the group of frequencies for which the magnitude spectrum of a given signal is not zero is defined as BW of signal.

$f(t) = Sa(t) \xleftrightarrow{FT}$

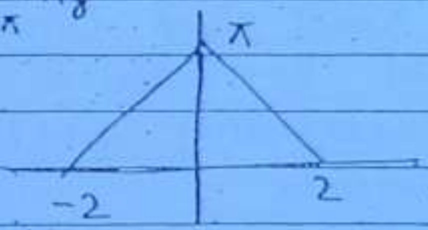


143

$BW = 1$ rad/sec

$= \frac{1}{2\pi}$ Hz

$Sa^2(t) \xrightarrow{FT}$

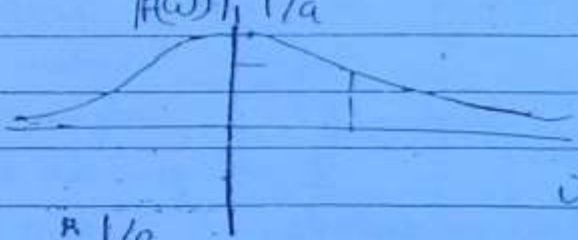


$\therefore B.W = 2$ rad/sec

$= 1/\pi$ Hz

$f(t) = e^{-at}\,u(t)$

$\longleftrightarrow \frac{1}{a+j\omega}$



BW ideally $= \infty$.

$|F(\omega)| = \frac{1}{\sqrt{a^2+\omega^2}}$ $\frac{1/a}{\sqrt{1+\omega^2/a^2}}$

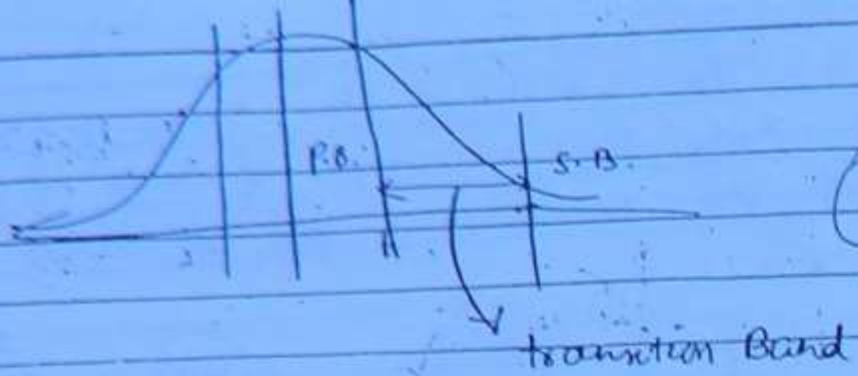
at $\omega = a \longrightarrow |F(\omega)| = \frac{1}{\sqrt{2}}(1/a)$

$\therefore B.W = a$ rad/sec 3d.B B.W of signal.

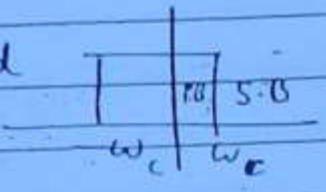
$= \frac{a}{2\pi}$ Hz. Ans

* 3d.B B.W. of a signal, the width the group of frequencies for which $|F(\omega)| \geq \frac{1}{\sqrt{2}} |F(\omega)|_{max}$

Q. for a signal $f(t) = e^{-at}\,u(t)$, calculate the range of frequencies to be consider such that these frequencies considered contributes 50% total energy of signal



Δ Ideal L.P.F. has no transition band



* Ideal filters have sharp cutoff frequencies separating the pass band & stop band where as practical filters have a group of frequencies separating pass band & stop band defined transition band. Moreover the magnitude response of practically possible system can't be ~~mag~~ ~~maxium~~ absolutely flat over a range of frequency neither it can be zero for a range of frequency. ideally speaking B.W of the above system is ∞ but it is easily seen that this system is capable of making available only the frequency for which

$|H(\omega)| > \frac{1}{\sqrt{2}}|H(\omega)|max$,

* ~~For all practical purposes~~ $|H(\omega)| > \frac{1}{\sqrt{2}}|H(\omega)|max$

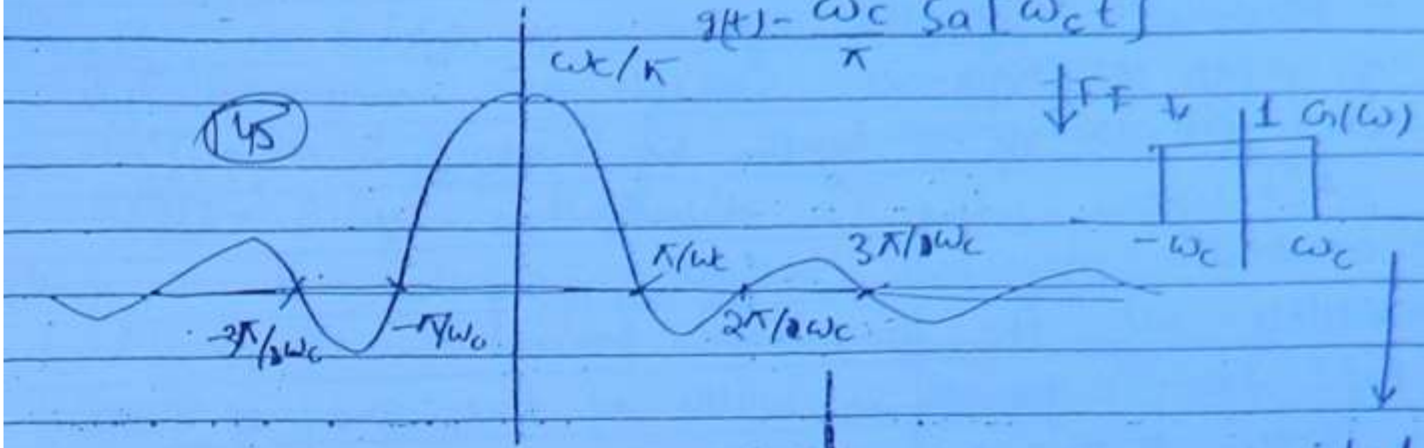
i.e. Lower group of frequency of i/p at the O/P.

* For all practical purposes we define the width of these group of frequencies as 3dB B.W. of the system where 3dB B.W. is defined as width of those group of frequencies for which $|H(\omega)| \geqslant \frac{1}{\sqrt{2}}|H(\omega)|max$

$$\boxed{B.\omega = \omega = \frac{1}{2\pi RC} Hz \quad = \frac{1}{RC} \text{ Radian/Sec}}$$

(145)

$g(t) = \frac{\omega_c}{\pi} Sa[\omega_c t]$



ideal system we can't realize physically

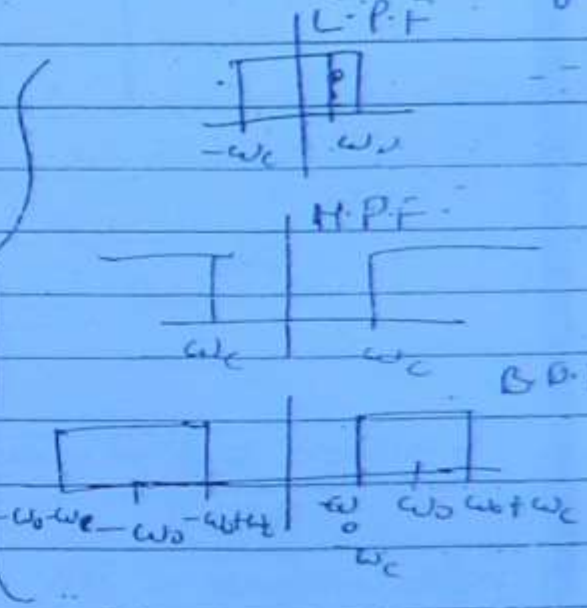
$\because h(t) \neq 0 \quad t<0$

non causal

So we can't realize this system physically

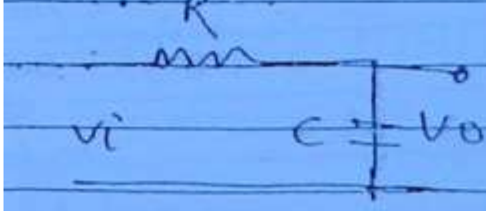
all are ideal systems

not possible

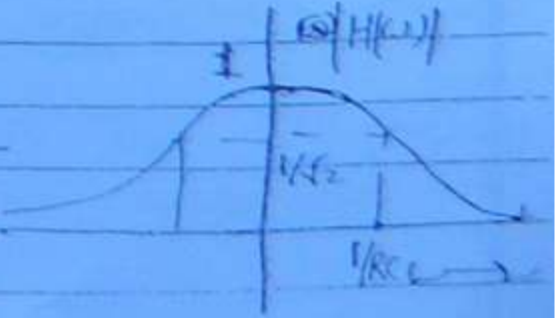


$= \frac{1}{SC} \cdot \frac{X}{R+1/SC}$

$H(\omega) = \frac{1}{RCS+1} = \frac{1}{J\omega RC+1}$



$|H(\omega)| = \frac{1}{\sqrt{\omega^2 R^2 C^2 + 1}}$



$\omega << 1/RC \quad |H(\omega)| = 1$

$\omega >> 1/RC \rightarrow |H(\omega)| \rightarrow 0$

* Bandwidth of the system is defined as the width of group of frequencies which are made availble at the O/P of a system by a system. (146)

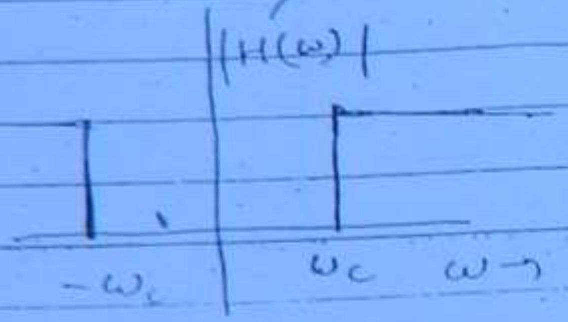
A system which is distortionless system has a constant magnitude response imply that it can make availble all the frequencies present in the I/P at the O/P right from 0 to ∞. So width of these group of frequencies is ∞. Hence B W = ∞

graph
for a real h(t)

|H(ω)| H(ω)

↓

is will be always even



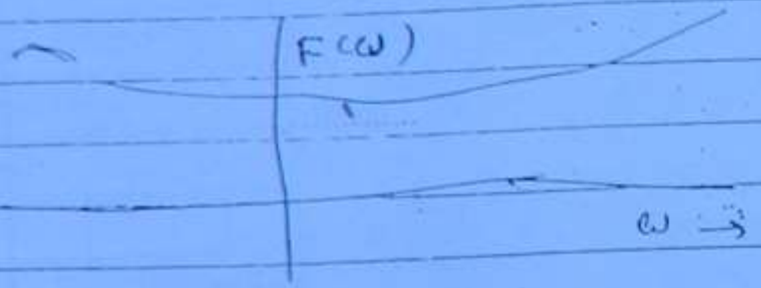
$|H(\omega)| = \sqrt{H_R^2 + H_I^2}$

↓ $(\text{even})^2$ fun of ω   ↓ (odd fun)^2

H_R

∴ H(ω) is even conjug

for h(t) to be re



∴ $|H(\omega)| = \sqrt{\quad}$

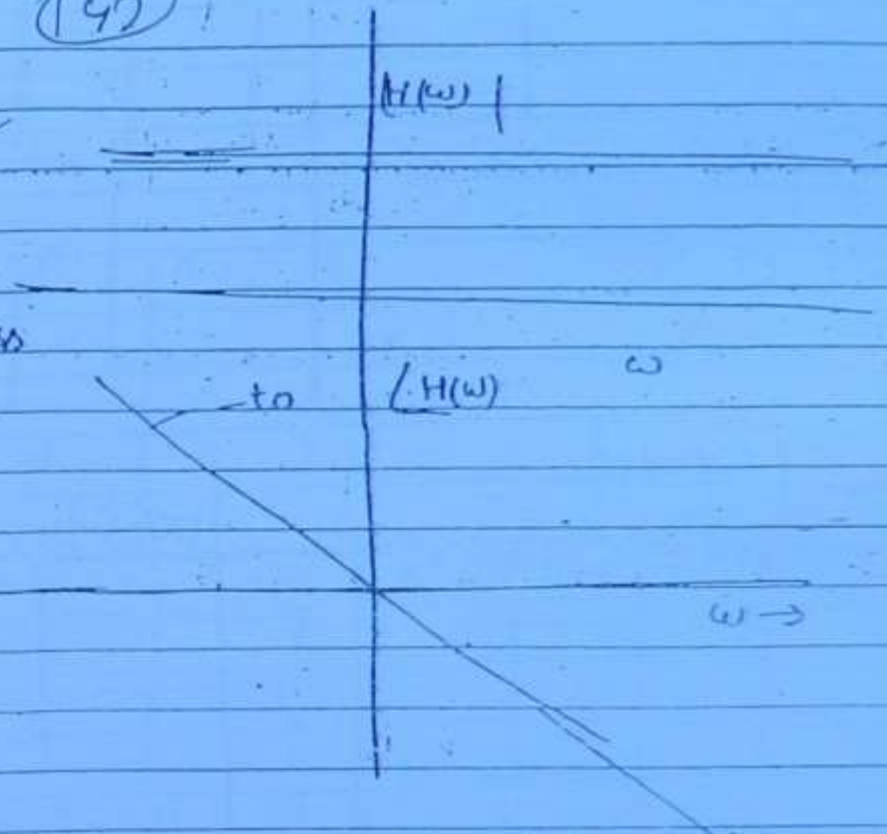
$H(\omega) = A e^{-j\omega t_0} \times 2\pi$

(42)

$$\left\{\begin{array}{l} |H(\omega)| = A \\ \angle H(\omega) = -\omega t_0 \end{array}\right.$$

condition for distortionless transmission.



* A system is said to be distortionless system, if it allows only two change in the i/p a scaler multiple a A to i/p and an uniform delay to. i.e. response to an i/p f(t) should be of the form $A f(t-t_0)$.

Transfer func: $H(\omega) = A e^{-j\omega t_0}$ which insures constant magnitude response & linear phase response with −ve slope

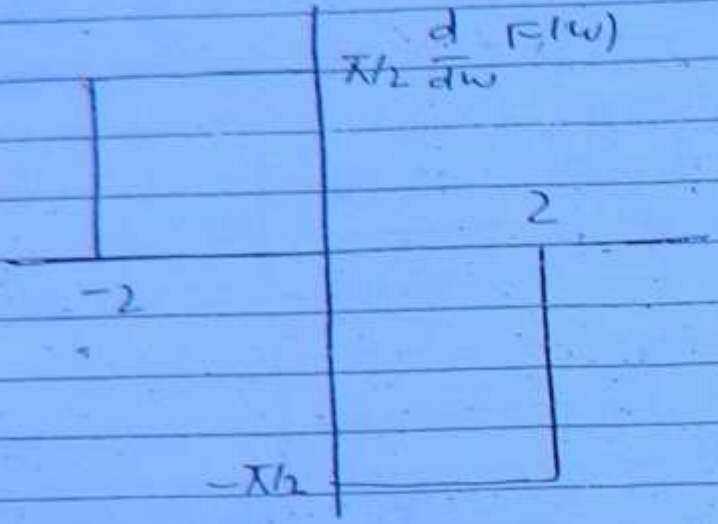
$|H(\omega)| = A$

$\angle H(\omega) = -\omega t_0$

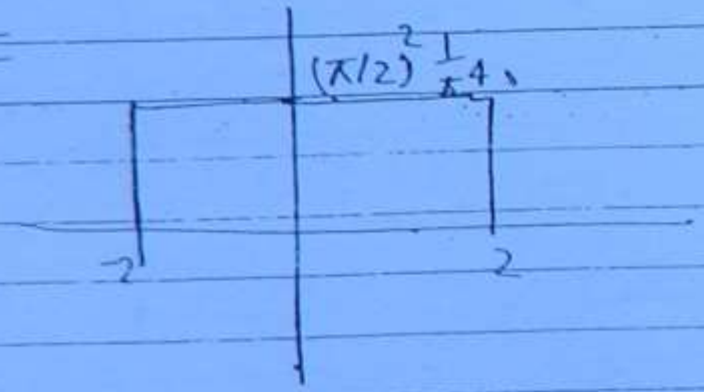
(*) Constant magnitude response insures that all frequency components present at i/p will be carried to the o/p without change in shape

(*) And linear phase response ensures sequence of information in time domain i.e all time components are given uniform time delay

$$F(\omega) = \frac{1}{\pi^2} j \frac{d}{d\omega} F_1(\omega).$$



$|F(\omega)|^2 =$



$$\therefore E = \frac{1}{2\pi} \times 4 \times \frac{1}{2\pi^3} \cdot \frac{\pi}{2}$$

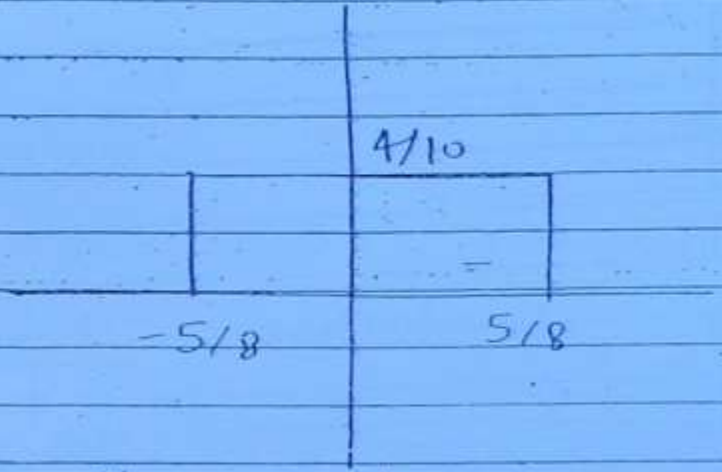
$$F(\omega) = \frac{2 \sin\omega T/2}{\omega} = \underset{\substack{\downarrow \\ \text{area of pulse}}}{\textcircled{T}}\, Sa(\omega \underset{\substack{\downarrow \\ \text{half of width}}}{\textcircled{T/2}})$$

T. T/2

$$F(\omega) = T \cdot \operatorname{Sinc}\frac{\omega T}{2\pi}$$

$$\frac{T}{\pi\, \omega T/2\pi} \quad \sin\theta$$



$$4/10 \times \frac{2 \times 5}{8}_2$$

$$\frac{1}{2} Sa\left(\frac{5\omega}{8}\right)$$

$e^{-at}u(t)$, $e^{at}u(t)$, $\delta(t)$, $rect(t) \xrightarrow{F.T.}$ is completely defined F.T.

$Sgn(t)$, 1, $e^{j\omega_0 t}$, $\cos\omega_0 t$, $\sin\omega_0 t$, $u(t) \rightarrow$ F.T. is not completely defined for all values of ω.

Existence of Fourier Transform →

$$F(\omega) = \int_{-\infty}^{\infty} f(t)\, e^{-j\omega t}\, dt$$

$$|F(\omega)| < \infty$$

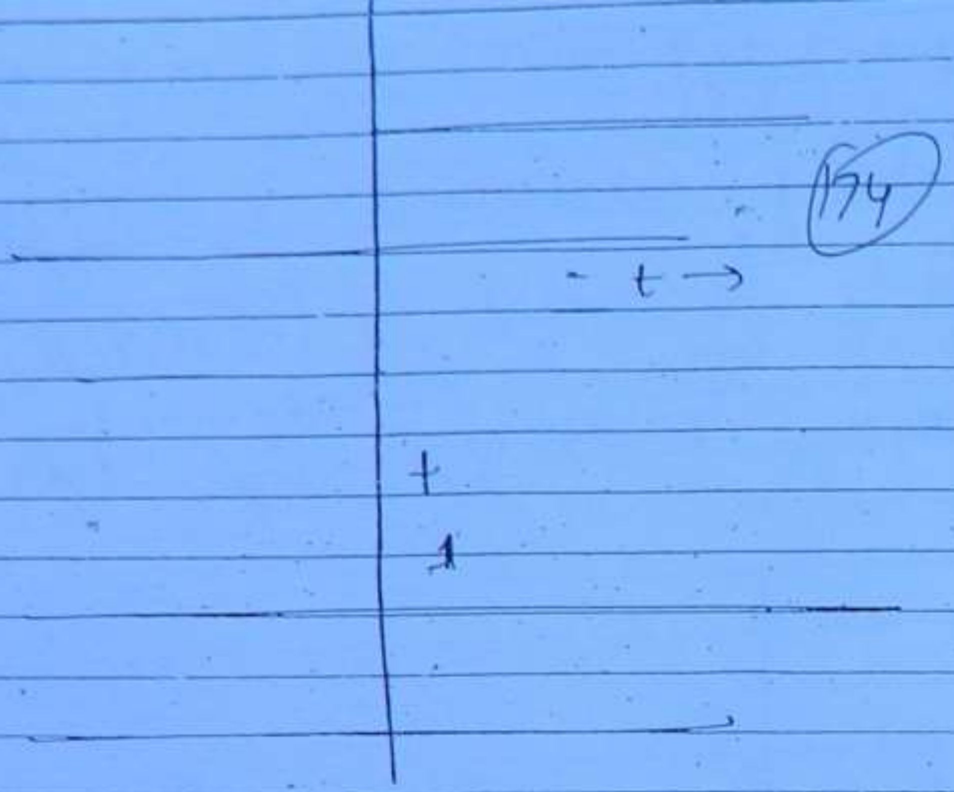
$$\left|\int_{-\infty}^{\infty} f(t)\, e^{-j\omega t}\, dt\right| < \infty$$

~~$\left|\int_{-\infty}^{\infty} f(t)\, dt\right| < \infty$~~

Imp — if this condition is satisfied then only we can use the integral formula for calculation of F.T.

$$\int_{-\infty}^{\infty} |f(t)|\, dt < \infty \longrightarrow \text{for well defined F.T.}$$

f(t) must satisfy this condition.



||=
