SUMMER – 2019 EXAMINATION MODEL ANSWER

Subject: Data Structure Using 'C'

Subject Code: 22317

Important Instructions to examiners:

- 1) The answers should be examined by key words and not as word-to-word as given in the model answer scheme.
- 2) The model answer and the answer written by candidate may vary but the examiner may try to assess the understanding level of the candidate.
- 3) The language errors such as grammatical, spelling errors should not be given more Importance (Not applicable for subject English and Communication Skills).
- 4) While assessing figures, examiner may give credit for principal components indicated in the figure. The figures drawn by candidate and model answer may vary. The examiner may give credit for any equivalent figure drawn.
- 5) Credits may be given step wise for numerical problems. In some cases, the assumed constant values may vary and there may be some difference in the candidate's answers and model answer.
- 6) In case of some questions credit may be given by judgement on part of examiner of relevant answer based on candidate's understanding.
- 7) For programming language papers, credit may be given to any other program based on equivalent concept.

SUMMER – 2019 EXAMINATION MODEL ANSWER

		<u>-</u> _
	<pre>struct node *q; if(start==NULL) { printf("list is empty\n"); } q=start; printf("list is:\n"); while(q!=NULL) { printf("%d\t",q->info); q=q->next; } }</pre>	
(c)	Draw and explain construction of circular queue.	4M
Ans.	A queue, in which the last node is connected back to the first node to	-4141
	form a cycle, is called as circular queue.	
	7 0 Front 10 10 10 1 8	Draw 1M
	The above diagram represents a circular queue using array.	
	It has rear pointer to insert an element and front pointer to delete an element. It works in FIFO manner where first inserted element is deleted first. Initially front and rear both are initialized to -1 to represent queue empty. First element inserted in circular queue is stored at 0 th index position pointed by rear pointer. For the very first element, front pointer is also set to 0 th position. Whenever a new element is inserted in a queue rear pointer is incremented by one. If rear is pointing to max-1 and no element is present at 0 th position then rear is set to 0 th position to continue cycle. Before inserting an element, queue full	Explana tion 3M
	condition is checked. If rear is set to max-1 position and front is set to	
	0 then queue is full. Otherwise if rear =front+1 then also queue is full.	

(Autonomous)

(ISO/IEC - 27001 - 2005 Certified)

SUMMER – 2019 EXAMINATION MODEL ANSWER

 		1
(d) Ans.	If queue is full then new element cannot be added in a queue. For deletion, front pointer position is checked and queue empty condition is checked. If front pointer is pointing to -1 then queue is empty and deletion operation cannot be performed. If queue contains any element then front pointer is incremented by one to remove an element. If front pointer is pointing to max-1 and element is present at 0 th position then front pointer is initialize to 0 th position to continue cycle. Circular queue has advantage of utilization of space. Circular queue is full only when there is no empty position in a queue. Before inserting an element in circular queue front and rear both the pointers are checked. So if it indicates any empty space anywhere in a queue then insertion takes place. Explain indegree and outdegree of a graph with example. Indegree of node: It is number of edges coming towards a specified node i.e. number of edges that have that specified node as the head is known as indegree of a node. Outdegree of node: It is number of edged going out from a specified node i.e. number of edges that have that specified node as the tail is known as outdegree of a node In undirected graph each edge is bidirectional so each edge coming towards node is also going out of that node. Due to this indegree and outdegree of a node is same number. In indirected graph, each edge is having direction associated with it, so indegree and outdegree	4M Each term- explanat ion 1M
	depends on the direction. Example:-	
	A C C	Each example 1M
	Indegree of node A=1 Outdegree of node A=2

SUMMER – 2019 EXAMINATION MODEL ANSWER

Subject: Data Structure Using 'C'

Subject Code:

22317

9. j=8,i-1 since a[j] > pivot do nothing array will remain sa	same
---	------

Array elements	2	3	6	22	50	39	49	25	18	5
indexes	0	1	2	3	4	5	6	7	8	9

We come out of loop because j is now equal to high-1.

Finally we place pivot at correct position by swapping a[i+1] and a[h] (or pivot)

 $a[] = \{2,3,5,22,50,39,49,25,18,6\} // 6 \text{ and } 5 \text{ Swapped}$

Now, **5**is at its correct place. All elements smaller than 5 are before it and all elements greater than 5 are afterit.

Similarly rest of the passes will be executed and will provide the following output

Output of pass1

Array elements	2	3	5	22	50	39	49	25	18	6
indexes	0	1	2	3	4	5	6	7	8	9

Pass2

 $A = \{2.3\} \text{ pivot} = 3$

LJ (-,-)			
Array elements	2	3	5
indexes	0	1	2

SUMMER – 2019 EXAMINATION MODEL ANSWER

	(c)	Write an algorithm to count number of nodes in singly linked list.	6M
	Ans.	Let	
		start is pointer variable which always stores address of first node in	
		single linked list. If single linked list is empty then start will point to	
		NULL.	
		q is pointer variable used to store address of nodes in single linked	a .
		list.	Correct
		Step 1: Start	algorith m 6M
		Step 2: [Assign starting address of single linked list to pointer q] q=start	m om
		Step 3: [Initially set count of nodes in Linked list as zero] count=0	
		Step 4: [Check if Linked list empty or not]	
		if start==NULL	
		Display "Empty Linked List"	
		go to step 6.	
		Step 5: [Count number of nodes in single linked list]	
		while q!=NULL	
		count++ and	
		q=q->next;	
		Step 6: Display count (total number of nodes in single linked list)	
		Step 7: stop	
6.		Attempt any TWO of the following:	12
	(a)	Sort the following numbers in ascending order using Bubble sort.	6M
		Given numbers: 29, 35, 3, 8, 11, 15, 56, 12, 1, 4, 85, 5 & write the	
	A	output after each interaction.	
	Ans.	Pass 1	
		Enter no of elements :12	
		Enter array elements :29 35 3 8 11 15 56 12 1 4 85 5	
		Unsorted Data: 29 35 3 8 11 15 56 12 1 4 85 5
